Red Hat Coverage -Blue Yonder

Invited Brad Childress Mark Anderson Bill Venella Jason Anderson prudhvi.vadde@blueyonder.com

Attachments Red Hat Coverage -Blue Yonder

Meeting records Transcript

Summary

Prudvi is in FinOps.

VMware renewal is Q2 2028 10-12k VMs

Interested in understanding more about Openshift Virt (Follow up)

Acquired a number of legacy supply chain platform: LEGACY =Heritage

Building out a Cognitive Suite or Products (Azure and Snowflake)

Alot of RHEL ELS???

Brad Childress introduced the new Red Hat contacts, Bill Venella and Jason Anderson, as they look forward to collaborating with Blue Yonder on existing near-term and long-term initiatives. Prudhvi V confirmed they pay for extended support, which Bill Venella committed to resolving, and the group discussed the separation of Red Hat and IBM operations and contracts despite IBM's ownership, aligning with Prudhvi V's mention of IBM's vendor consolidation. The discussion also covered Blue Yonder's significant RHEL investment through reseller HCL, the use of technologies like Confluent and HashiCorp Terraform, and the potential of embedded agreements for better cost predictability, especially when considering VMware alternatives. Bill Venella proposed Open Shift as a Kubernetes-based hypervisor alternative for Blue Yonder's **10,000 to 12,000 VMs, which Prudhvi V confirmed they are migrating to Azure, noting their applications use Red Hat as the operating system with various databases.** Jason Anderson emphasized Open Shift's ability to serve as a single, consistent platform for containerized applications and VMs across both on-prem and Azure environments, which Prudhvi V is interested in, requesting documentation on VMware migration to share with their teams. Bill Venella committed to a 90-minute follow-up meeting with industry experts regarding the VMware migration proposal to align with Blue Yonder's architecture, product usage, and life cycle plans.

Details

- **Introduction of New Red Hat Contacts**: Brad Childress introduced Bill Venella and Jason Anderson as the new primary points of contact for Red Hat, replacing themself to help ensure a smooth transition. Brad Childress noted that they are excited to begin working with Blue Yonder and mentioned existing near-term and long-term initiatives that they look forward to collaborating on (00:00:00). Bill Venella, based in Philadelphia and working with Red Hat for nearly 10 years, explained that their goal is to help strategic accounts like Prudhvi V's organization become more successful by understanding their architecture and challenges, which hopefully leads to them purchasing more products (00:01:12).
- **Discussion of IBM and Vendor Consolidation**: Prudhvi V confirmed that they are paying for extended support, which Bill Venella noted they need to find a plan to resolve. Prudhvi V inquired about the relationship between Red Hat and IBM, and Bill Venella clarified that while IBM owns Red Hat, contracts and most operations, including who pays them, are separate (00:02:39). Prudhvi V mentioned that IBM has recently consolidated their engagements, providing one account manager for the Blue Yonder Panasonic entity, and Bill Venella stated that Red Hat aligns with IBM where it makes sense but maintains separation otherwise (00:03:42).
- **Technology Acquisition and Current Systems**: Prudhvi V confirmed Red Hat is aware of ongoing discussions with Nate regarding consolidating IBM engagement into a single effort, but Bill Venella reiterated that Red Hat's contracts remain separate (00:04:50). The conversation moved to acquired technology, with Prudhvi V confirming they use Confluent and some HashiCorp products, specifically Terraform. Bill Venella asked about Ansible usage, and Brad Childress confirmed Blue Yonder currently uses it, though Prudhvi V was unsure (00:05:58).
- **Red Hat Enterprise Linux (RHEL) Investment and Reseller Model**: Bill Venella noted that Blue Yonder's RHEL investment is significant and is purchased through HCL, which Prudhvi V confirmed is a reseller and not a managed service provider. Bill Venella mentioned that Red Hat offers embedded agreements, which involve upfront investment and provide additional support and cost predictability, aligning costs with sales forecasting (00:07:28). The discussion of cost predictability was presented as helpful for RHEL and for investigating VMware alternatives (00:08:48).
- **VMware Alternatives and Migration Strategy**: Prudhvi V expressed interest in hearing about VMware alternatives due to significant price increases over the last year (00:08:48). Bill Venella proposed Open Shift as a modern, Kubernetes-based hypervisor alternative that works in both data center and cloud environments, assisting with cost avoidance and preventing the duplication of

costs when migrating workloads (00:10:19). They mentioned having an easy migration utility to lift and shift workloads, with the added capability of helping to modernize or containerize them (00:11:32).

- **VMware Environment Details and Follow-up Meeting**: Prudhvi V confirmed they have about 10,000 to 12,000 virtual machines (VMs) on a private cloud and are currently trying to migrate them to Azure, with two years remaining on their three-year VMware contract, which renews in Q2 2028 (00:11:32). Bill Venella committed to setting up a follow-up meeting with industry experts, estimating a 90-minute session would be required to provide a general overview of the features, which they noted are compelling to VMware customers (00:12:51). Jason Anderson inquired about Blue Yonder's current container usage, to which Prudhvi V confirmed they use containers in Azure for both application and database servers (00:14:10).
- **Blue Yonder's Supply Chain Platform and Databases**: Prudhvi V explained that Blue Yonder is a supply chain software company with its own applications managing areas like transportation and warehouses. Their applications use Red Hat as one operating system and incorporate various databases, including Oracle, SQL, Postgress, Mongo, Cosmos, and Snowflake (00:15:24). Prudhvi V clarified that their current strategy involves modernizing their applications into a "cognitive suite" built natively on Azure, with Red Hat as the operating system and using Kubernetes and Snowflake (00:21:34).
- **Open Shift as a Unified Platform**: Jason Anderson emphasized that Open Shift's most compelling feature is serving as a single platform that can host containerized applications and VMs, regardless of location (on-prem or Azure). Jason Anderson highlighted the advantage of a unified platform where teams learn a single system, ensuring consistency no matter where they are working (00:16:33). Bill Venella reinforced that Open Shift addresses the "burning platform" of VMware by offering a single platform that works across all environments to aid in migration velocity, updates, and even running AI models (00:17:43).
- **Request for Documentation and Next Steps**: Prudhvi V requested documentation about the VMware migrations to share with their technical teams, as they are interested in learning more about the proposal. Prudhvi V apologized for not knowing what tool is currently used for automation, attributing this to Blue Yonder's history of mergers and acquisitions, which resulted in multiple applications and heritage products (00:20:12) (00:24:14). Bill Venella committed to following up on the VMware migration discussion and noted that the long-term goal is to understand Blue Yonder's architecture, product usage, and life cycle to align with their plans (00:18:57).

Suggested next steps

Bill Venella will send documentation about the VMware migrations to Prudhvi V.

- Prudhvi V will socialize the VMware migration documentation internally and come back to the group with next steps, and bring in the right technical folks for the follow-up meeting.
- Prudhvi V will send a note to Bill Venella and Jason Anderson along in terms of what they want to talk about.
- Bill Venella and Prudhvi V will set up a follow-up 90-minute meeting with industry experts to discuss VMware alternatives and the transition to Azure.

Red Hat Coverage -Blue Yonder - Transcript

00:00:00

Brad Childress: Um, and I know they're super excited to step in and start working with Blonder. Um, so definitely just wanted to take the chance to to get you guys introduced provy and I know there were a couple near-term uh things that we were working on last year and then a couple just longer term broader initiatives that we wanted to work with uh with each other on. Um, so happy to pick up there. Uh, I I wanted to join today uh just to help with the transition, make sure that nothing was lost here. Uh, but then going forward, Bill and Jason will really be kind of your your main points of contact for all things Red Hat here.
Prudhvi V: Got it. Good to
Brad Childress: Um, so Bill, I'll let you kind of kick things off or introduce yourself a little bit more here if you want
Prudhvi V: good.
Bill Venella: Yeah,
Brad Childress: to.
Bill Venella: thank thanks Brad. I appreciate all the the kind words. Yeah, so Provy, thank you for uh for joining as Brad said.

00:01:12

Bill Venella: Uh so I uh I'm Bill Vanilla. I'm based in Philadelphia. Uh geographically challenged compared to where you are, but uh that's all good. There's there's a plane that'll get us there. Uh but I've been with uh Red Hat actually I'm working on my 10th year. Uh and just like Brad said, like we we work on some of our most strategic accounts and uh in a different way, right? So we uh we look at uh organizations like you, right, that uh have a good uh working understanding of our product set and we figure out how to make you more successful with our products. Right? So our goal is to dig in, understand your architecture, why you have things set up a certain way, uh talk about uh projects and then how do we align better, right? So uh our whole goal is to make you successful and uh the only way you're successful is if uh you know if we can get all the uh challenges out of the way, right? So, so one, we want to understand if uh if you're experiencing any of those, and then two, you know, hopefully you're happy enough that uh we can get you to to double down and buy more, right?

00:02:39

Prudhvi V: Not yet, but we are definitely paying the extended support. So,
Bill Venella: Extended support. We need we need to figure out a a plan to get you off of that.
Prudhvi V: yeah. Yeah.
Bill Venella: Definitely.
Prudhvi V: No, absolutely. No, uh nice to meet you. I think first Brad, uh appreciate the intro here and great work working with you so far. Hopefully, you're going to enjoy a new role. Uh Bill and Jason, um thanks for, you know, taking over. Uh it's been nice working with the um you know, Brad and team so far and looking forward to working with you guys uh going forward. But uh uh I I wanted to uh kind of give another quick update which we made progress some progress with IBM as well. Overall you guys are part of IBM right?
Bill Venella: Well,
Prudhvi V: Uh
Bill Venella: sort of we are. So, IBM owns us, but that's probably where the connection stops,
Prudhvi V: Mhm.
Bill Venella: right? All of our contracts are are uh separated.

00:03:42

Bill Venella: Uh and pretty much everything else is separated other than I mean even
Prudhvi V: Okay.
Bill Venella: uh even my who who pays me uh IBM doesn't pay me, Red Hat pays me, right? So,
Prudhvi V: Yeah. Yeah. Okay. No, the reason I brought that up is because u IBM obviously they have bunch of different uh companies they're acquiring, you know, something or the other every year. uh and we have uh we've had some challenges having different salespeople and different

Bill Venella: Thank you.
Prudhvi V: teams working with us on all the various uh solutions that we use from IBM. Uh earlier this year they have kind of consolidated all the um you know engagements across different purchases that we had. We have one manager now or one account manager for Blue Yonder Panasonic uh entity. So I don't know if you guys are aware of it or if it's something
Bill Venella: We we yeah we we've connected with them uh you know we we align where it makes
Prudhvi V: different.
Bill Venella: sense and uh we stay separate where it also makes sense right

00:04:50

Prudhvi V: Okay. Okay.
Bill Venella: uh
Prudhvi V: So does like uh are you referring to Nate? I think Nate is a person who actually reached out to me. Uh okay. All right. U just wanted to make sure you guys are aware because there are some conversations going on with Nate and others just to consolidate all the efforts and looking at the IBM engagement as uh one single thing overall. U just wanted to kind of keep you updated on what's going on on the other side.
Bill Venella: Yeah. No, that that uh that's definitely important, right? Uh so we we definitely want to align uh those conversations, right? Uh and like I said, where it makes sense uh we will partner with them uh to provide a more comprehensive view of uh how the technology works together. But unfortunately today our contracts are still separated,
Prudhvi V: M
Bill Venella: right?
Prudhvi V: okay sounds
Bill Venella: So, did they did they uh did IBM acquire some technology that you're currently
Prudhvi V: good.
Bill Venella: using

00:05:58

Prudhvi V: Yeah, we recently the confluent as well. Uh guys might
Bill Venella: Fluent? Okay.

Prudhvi V: know.
Bill Venella: So, CL Confluent. How about Hashi Corp stuff?
Prudhvi V: I think we have some hashikorb
Bill Venella: Anything?
Prudhvi V: too.
Bill Venella: Okay. Uh Vault or Terraform or both?
Prudhvi V: Uh terraform for sure. I need to check on the vaults.
Bill Venella: Okay. So, uh I mean you're are you an Anible customer?
Prudhvi V: Uh, what is it? Sorry. Again.
Bill Venella: Anible automation.
Prudhvi V: Uh, I'm not sure.
Brad Childress: Leander is today.
Prudhvi V: I'm not
Bill Venella: Blue Yonder is not okay.
Prudhvi V: sure.
Bill Venella: Well, in my in my limited view of uh investigation, Prudv, right, it looks like you guys sell software. Uh we have some interesting solutions from a business perspective on, you know, how to make costs more predictable for companies that sell soft sell our software combined to a full solution. Uh if that makes sense, right? If you're if you're doing that with Red Hat products, maybe that's something that we should uh have further discussion about uh looks like your your your rail uh is a pretty big investment today, right?

00:07:28

Prudhvi V: Yeah,
Bill Venella: But you buy that through HCL.
Prudhvi V: that's
Bill Venella: So, is that uh is that supported through HCL or is it
Prudhvi V: correct.
Bill Venella: a package solution that you're selling to to customers?
Prudhvi V: Uh I mean we run our applications on Red Hat. So it's when you say it's supported through HCL uh maybe
Bill Venella: Yeah. So is is HCL providing a managed service around our
Prudhvi V: can
Bill Venella: product in addition to the support that they give you? And then so and then B is they're just a reseller.
Prudhvi V: I don't think so. It's just a reseller. They're just resellers of

Bill Venella: Okay. Got it. Okay.
Prudhvi V: Yeah.
Bill Venella: All right. So yeah, some from a business perspective, we have uh a number of programs that you know I can walk you through and uh give you idea of how to consolidate costs, right? Uh but it'd be more around uh we call it our embedded agreements, right? So what it is at a high level is we we work with you and connect around uh sales and and forecasting, right?

00:08:48

Bill Venella: So, if you're if you're selling a bunch of uh widgets on on your end and you're combining it with Red Hat tools, uh what we would do is we would ask you to buy make an investment upfront and then uh through that investment uh you get additional levels of support on how to use the technology. ology uh and embedded into your product offerings uh to make it more seamless. But in addition to that, it also helps to uh make the cost more predictable, right? So that uh as you add more, one, it more aligns with your uh your sales and your sales forecast, but then two, it also uh helps you predict what the costs are going to be over a longer period of time, right? So where that's helpful is well one from a rail perspective but then I don't know if there are have you been doing any investigation around uh VMware alternatives and hypervisor alternatives.
Prudhvi V: Uh we would love to hear what the VMware alternatives are. Uh you may already know that uh the crazy price increases that they have done last year for almost I think everybody in the market.

00:10:19

Bill Venella: Yes,
Prudhvi V: So I'd love to hear what you guys uh if you guys have any uh options
Bill Venella: we we do we actually have uh a very interesting option. Right. So, uh, everybody's been running to the fire and, uh, providing an an alternative. Uh, we we would say we have a a more modern alternative to, uh, to the hypervisor environment. I'd love to take you through that uh, in an alternate uh, discussion. uh but I think the the other side of it is from a business case perspective we can help you transition those costs. So if if those workloads are eventually going to the cloud we can help you from a cost avoidance perspective uh reduce the duplicating of costs. So one in the data

center and then uh one in the cloud and and the example of that is if I have a multi-year agreement uh in VMware and then I you know the day after I move one of those workloads to the cloud now I've just duplicated my costs right so how do I how do I take that workload and uh put it on a platform that actually works

00:11:32

Prudhvi V: Yep.
Bill Venella: in both environments. So one we have uh an easy migration utility that uh allows us to lift and shift those but also help to modernize right if if there's an ability to containerize that we can we can help you do that as well and then based on where uh the customer needs are e either in the data center or in the cloud we can help you uh move the cost with the workload Right? So, you're only spending it once, right? And that's that's our solution around Open Shift, right? It's a Kubernetes-based solution that works in uh all of your environments
Prudhvi V: Okay. So,
Bill Venella: essentially.
Prudhvi V: we do have our VMware environments that uh we are obviously trying to migrate to Azure at this point. Uh so,
Bill Venella: Okay.
Prudhvi V: I'd love to learn more about what you just explained in terms of how you guys can help us in that overall
Bill Venella: Okay. Yeah,
Prudhvi V: transition.
Bill Venella: we we'll set up a followup. Uh so I have some industry experts on on my end that we can bring to the table.

00:12:51

Prudhvi V: That's good.
Bill Venella: One question that uh everybody will ask is so there's two questions. One, how many VMs? And then two, when is your uh how long did you renew for on your VMware uh agreement?
Prudhvi V: Well, we have we have about 10 to 12,000 VMs on our private cloud that we are trying to migrate and
Bill Venella: Okay.

Prudhvi V: our VMware contract is uh 3 years. I think we still have two years left.
Bill Venella: Two years left. Okay. renews at the beginning of the year or end of
Prudhvi V: I think it renews in I think sometime in second quarter in 28.
Bill Venella: year. Okay. Q228. All right. Well, yeah, like like I said, we'll uh we'll follow up with we probably need 90 minutes just to go through uh just a general overview, right? uh we've really made some uh strategic additions from a feature set uh late last year that uh seem to be very compelling to uh to
Prudhvi V: Mhm.
Bill Venella: VMware customers.

00:14:10

Bill Venella: Would you add anything to that uh Jason?
Jason Anderson: Um, yeah, I actually I would, but I have to ask two more questions. Um, just because I'm a technical guy. Um, do you guys do containers at all? I see you have a bunch of real subs, but are you doing Podman and containers anywhere or do you have any of that for your application management?
Prudhvi V: Uh we do do containers in Azure. So we have uh our our environments there. What's the second question? Jason, can you come
Jason Anderson: I uh let's see basically I wanted to know what
Prudhvi V: again?
Jason Anderson: environment you were running them in uh containers in and uh basically what are your applications that you're running um you know are you running web servers are you running databases can you give me a little bit more detail about Yeah.
Prudhvi V: both uh we are serving application servers as well as database servers. So we Oh did I did we lose Jason?
Bill Venella: I think so.
Prudhvi V: Jason I think we lost you.

00:15:24

Bill Venella: So is it it's an application that you guys have created,
Prudhvi V: Yeah. So,
Bill Venella: right?
Prudhvi V: Blue Yonder is a supply chain software company as you guys know.

Bill Venella: That uh
Prudhvi V: Uh,
Bill Venella: Yep.
Prudhvi V: so we we have our own sub supply chain applications that manages like warehouses, transportation, uh, stores and stuff like that. So, we use Red Hat as one of OS uh in our applications and we use database as well. We have bunch of different databases that we uh that we have. I you guys name it, we have it in some of the other form and share. We have Oracle, SQL, Postgress, Mongo, Cosmos, Snowflake. We have all of them in various different form, various different applications.
Jason Anderson: Wow.
Prudhvi V: Uh they're all there. But I think the primarily in uh our Kubernetes, we use uh Red Hat as our OS. Um along with if I'm uh I probably need to bring in our technical folks, but we use bunch of different databases. uh they like Cosmos is used in some areas, Mongo is used in some areas, uh SQL pass is used in some areas and snowflake is used in some areas.

00:16:33

Prudhvi V: So it's just different but uh we use both database servers and app
Jason Anderson: Okay. Okay. So,
Prudhvi V: solos.
Jason Anderson: the reason that I was asking that question is the to me the most compelling feature of Open Shift is as Bill alluded to, it's one platform for everything. Um so if you're already doing containerized applications that can migrate over to open shift today. Um if you are doing VMs anywhere that can migrate over to open shift today. If you have planned to modernize your applications you have that platform that staging ground. Um and what is value that Red Hat brings is you can do that wherever you are. You mentioned that you do you have on-prem work that you're doing. You mentioned you have you know Azure work that you're doing. Um it will bring a a great advantage because everybody will learn a single platform. Nothing will change no matter where you're working and that is a huge advantage uh to the open shift aspect of this.
Prudhvi V: So just so I understand.

00:17:43

Prudhvi V: So when you guys talk about Open Shift, is it running on is it a I'm probably

going to mess this up because I'm not super technical. Uh uh is this running on IBM cloud or is this a software that can run on any cloud?
Jason Anderson: You can run on any
Bill Venella: can run anywhere and in the data
Jason Anderson: cloud.
Prudhvi V: Okay. Okay. So and data center as well.
Bill Venella: center.
Prudhvi V: Okay. So we we run our applications in Azure.
Jason Anderson: Yep.
Prudhvi V: So you guys already probably know that. Uh so what you're suggesting is instead of using Kubernetes is we use Open Shift. Is that
Bill Venella: Well, we we don't know yet. You know,
Prudhvi V: accurate?
Bill Venella: I think uh I think the opportunity right now is you have a burning platform which is VMware, right? Uh and you probably are moving legacy customers from uh that legacy technology to the cloud in a SAS offering. Right? So it Maybe there's an opportunity to have one platform that works against all of these uh environments to help you with that migration.

00:18:57

Bill Venella: And then you know I think the follow on to that is how do we create velocity for that that migration? How do we create velocity for updates and tech changes? How do we create velocity around I mean are you doing AI anything around AI uh in your product right so this this product
Prudhvi V: Yeah.
Bill Venella: also since it works in all of these environments will actually run uh your AI models right and and uh works on smaller LLMs to provide more uh efficiency and velocity right
Prudhvi V: Mhm.
Bill Venella: so a number of things I think uh we can have discussions around right uh but yeah I want to click through on the VMware stuff uh uh in the
Prudhvi V: Okay.
Bill Venella: near term but in the long term I think our goal is understand more about your architecture some of the products you're using uh some of the applications you know what uh what your life cycle looks like so that we can help align with your plans
Prudhvi V: Mhm. Okay. Okay. Yeah, it sounds good.

00:20:12

Prudhvi V: I mean, uh, if you guys have some documentation or something like that, you know, obviously I can pass it on to our technical teams and see if they're interested in, you know, spending some time with you to understand more about what you guys are talking about.
Bill Venella: Yeah, happy
Prudhvi V: Okay.
Jason Anderson: Happy um can I ask one last question? I'm sorry.
Prudhvi V: Yeah, I
Jason Anderson: Um you mentioned you um for answer you don't use anible for
Prudhvi V: know.
Jason Anderson: automation. Can I ask what you do use for automation and why you you made the choice that you made?
Prudhvi V: So uh I think the first answer actually I don't know what we are using for automation. Uh we may be using if you guys actually look at the history of Blue Yonder uh we we are a company of acquisitions and mergers over last 10 years. Uh and we acquired lot of different companies and merged with multiple companies. In last two years I think we acquired four different companies and every company that we are uh that is coming into blue yonder is coming with a new supply chain software suite and it was developed on various different applications that are not you know maybe used that was used or may not be used in the earlier applications that we had.

00:21:34

Prudhvi V: So uh that's the reason again why we are trying to modernize our applications today. Uh we're calling them a cognitive suite of products. Uh do check out our website. Uh you'll find probably more information you may actually get more technical information, you know, from their website than from me. Uh so we they're all uh we are building our own supply chain platform to unify all the different supply chain applications from planning uh to transportation, warehouse, order management and all of that together. Um and uh this application and obviously natively built on Azure with uh uh Red Hat obviously is is our OS with bunch of different databases. So um we do have lot of heritage products. We're calling our old version of products as heritage and new modern products as

Jason Anderson: Mhm.
Prudhvi V: cognitive. uh the heritage products today some of them are deployed on private cloud some of them are on public cloud Azure and anything and everything that's going to be deployed from now on will be cognitive will be on uh uh kubernetes and snowflake uh so we are in the process of migrating I think first we are actually migrating customers off of private to public uh our data centers into Azure some cases we are just migrating them in the same version into heritage Azure.

00:23:07

Prudhvi V: In some cases, we are actually migrating them to the latest and greatest cognitive versions that we have. Right? So, there are various different uh migration paths that are going on depending on the customer strategy. We have a lot of different customers at different uh stages of the supply chain maturity. So, depending on where they are, we are moving them to the next uh best possible option. So, that's where we are. uh and that's why we have hundreds of vendors, tens of databases, multiple applications in different uh uh you know product suite that we have. So uh I do need to bring in someone technical more technical. I'm in PHOPS as you guys know already. Uh so I I probably uh you know someone else can provide more details for you
Jason Anderson: Thank
Prudhvi V: guys.
Jason Anderson: you.
Bill Venella: Excellent. All right. Well, I I think that's all on my agenda. Prudie, is there anything else that we can uh help you do? Right. What's uh what's the be how do you like uh vendors to work with

00:24:14

Prudhvi V: Well,
Bill Venella: you?
Prudhvi V: I think we uh need to see where the uh uh uh opportunities are for us to engage. So um I I don't want us to take up more of your time if there's no opportunity right obviously there is Red Hat where we are already engaged and we work through the uh work through that those things and what you guys talked about like the VMware migrations where we are interested we'd love to know more. I think those are two things we can uh if you guys send some u documentation about the VMware migrations we'd

love to uh learn more. I'll uh you know socialize that internally and come back to you guys on the next steps. So any other things?
Bill Venella: Okay,
Prudhvi V: Yeah,
Bill Venella: that's
Prudhvi V: obviously just uh send me a note along in terms of what you guys want to talk about.
Bill Venella: fair.
Prudhvi V: I'll bring in the right technical folks for for you guys.
Bill Venella: Excellent. All right. Well, thank you for taking some time today. We appreciate uh the first intro. Looking forward to working with you this this
Prudhvi V: Absolutely.
Bill Venella: year. All right. Thank you.

Transcription ended after 00:25:39
