Hybrid Cloud and Satellite

Invited [Bill Venella](#) [Ira Fox](#) [Kishore Kagga](#) [Mothilal Gorak](#) [Jason Anderson](#) [Manikandan Ravindran](#) [Dana Singleterry](#)

Attachments [Hybrid Cloud and Satellite](#)

Meeting records [Transcript](#)

Summary

Discussion comparing Satellite versus Cloud Console functionality with a focus on licensing and the lack of standardization across Kubernetes platforms.

Red Hat and Blue Yonder Roles

Participants introduced their roles, with Red Hat providing Solutions Architects and Subject Matter Experts and Blue Yonder focusing on IT Infrastructure supporting core products running on legacy systems. Blue Yonder currently uses a large VMware production cluster and a single Satellite server primarily for Rail entitlement management.

Satellite vs. Insights Functionality

The core inquiry focused on whether Cloud Console or Insights could replace or augment their minimal Satellite usage for entitlement management and RPM repository needs. Satellite is favored for complex content crafting and life cycle management using content views, whereas Insights excels in vulnerability, advisory, and drift analysis.

Licensing and Automation Strategy

Blue Yonder confirmed their use of Ansible playbooks and Terraform via AWX but stated they would not purchase Ansible Automation Platform due to perceived high cost. The Bring Your Own Subscription model for Azure VMs was discussed, but it was noted as expensive compared to their current VMware licensing.

Details

- **Introductions and Location Discussion:** The meeting began with participants introducing themselves and discussing their geographic locations and current weather conditions, noting extreme temperature fluctuations in Northern Virginia and a storm in Atlanta, Georgia. Ira Fox joined the call, and the participants confirmed they could hear them clearly, setting the stage for the meeting.
- **Meeting Platform and Note-Taking Preference:** The participants discussed their preferred video conferencing tools, noting that their company primarily uses Teams for video, occasionally Zoom, but are currently on the Google platform. Ira Fox indicated a future preference for using Teams to leverage co-pilot's AI summarization features, while Jason Anderson offered to send the transcription and notes from the current call using Google's note-taking capabilities ([00:01:05](#)).
- **Red Hat Roles and Backgrounds:** Jason Anderson, a Solutions Architect for Red Hat supporting Panasonic and Blue Yonder, introduced themselves and mentioned their 14 years in research and development for the FAA before moving to Red Hat ([00:03:01](#)). Dana Singleterry, a Red Hat Rail Specialist and Subject Matter Expert (SME), introduced themselves, noting their nearly eight years at Red Hat, where they previously served as product manager for the Satellite product ([00:04:10](#)).
- **Blue Yonder Roles and IT Infrastructure:** Manikandan R. (Manny) introduced themselves as handling Unix, storage, backup, Azure, and some DevOps and automation at Blue Yonder for over 10 years. Ira Fox explained the organizational structure, noting that Blue Yonder has a Cloud Delivery team and an IT Infrastructure team (where Manny and they work) that supports all company functions, including development, support, sales, and finance ([00:06:06](#)).
- **Core Product Dependencies and Legacy Systems:** Ira Fox explained that although Blue Yonder is adopting cloud-native offerings, their core products still run on Rail, Windows, AX, Solaris, and HP UX. Ira Fox also shared their extensive history with Linux, dating back to its early days and their early support for Red Hat distributions ([00:07:29](#)).
- **Current Red Hat License Use Cases:** Blue Yonder utilizes a large VMware production cluster for build servers and a separate internal development environment (D4T) that uses specific licensing ([00:08:40](#)). Ira Fox noted that the cost implications of paying production licenses for all internal developers would constitute a "really big shift" ([00:09:42](#)).
- **Current Satellite Usage and Future Inquiry:** Blue Yonder currently uses a single Satellite server primarily for Rail entitlement management within their VMware environment ([00:09:42](#)). Ira Fox and Manny are exploring whether newer tools, like the hybrid console, offer new features that could replace or augment their current Satellite usage, especially with the emerging need to deploy Rail 10 ([00:10:56](#)).

- Automation Tools and Cost Considerations:** When asked about their current automation practices, Ira Fox confirmed they use Ansible playbooks and Terraform, controlled via GitHub Actions or AWX (the community version of Ansible). Ira Fox emphasized that they are not interested in purchasing Ansible Automation Platform due to its perceived high cost and the lack of a proven return on investment for their small team ([00:11:45](#)).
- Image Building and Satellite Versioning:** The team is experimenting with the image builder, accessed through the console, to address CIS hardening needs for Rail 10 ([00:12:44](#)). Manny confirmed they are running Satellite version 6.17, which is a supported version ([00:13:54](#)).
- Core Question: Satellite vs. Insights/Cloud Console:** Ira Fox and Manny's main inquiry is whether the Cloud Console/Insights can replicate Satellite's functionality or if they should continue with Satellite, which they currently use minimally for entitlement management and as an RPM repository. Ira Fox expressed a need for a Software as a Service (SaaS) solution for operating system patching that integrates with on-premise Satellite or capsule servers for security compliance ([00:15:06](#)) ([00:36:29](#)).
- Proxy and Capsule Functionality:** Dana Singleterry introduced the new "proxy" solution, which improves comfort for customers hesitant about SaaS security by routing connections through the proxy instead of directly from the hosts ([00:16:26](#)). Dana Singleterry clarified that the proxy does not function like Satellite capsules, which are used for low-latency situations, content distribution, and providing redundancy by maintaining functionality even if the main Satellite server fails ([00:17:39](#)).
- Management Tool Comparison and Use Cases:** Dana Singleterry presented slides comparing Satellite and Insights, explaining that Satellite is preferred by large enterprises and for highly secure, air-gapped, or low-latency environments where capsules are necessary ([00:20:06](#)). Insights' sweet spot is vulnerability, advisory, and drift analysis, while Satellite excels in complex content crafting and life cycle management using content views ([00:22:34](#)).
- Life Cycle Management and Patching Workflow:** Manny confirmed that Blue Yonder currently treats all machines as a development environment, applying patches simultaneously across all 100% of their servers ([00:25:02](#)). Dana Singleterry described the best practice workflow for large-scale patching, which involves stepping through development, QA, and production environments using versions and automation tools like AWX integrated with Satellite ([00:26:08](#)).
- Data Collection and Security Concerns for Insights:** Ira Fox noted they had not yet connected their systems to Insights due to needing a better understanding of what data it collects for security approval ([00:29:54](#)). Dana Singleterry explained that Insights data is highly encrypted on the host, transmitted via TLS with mutual authentication, and encrypted at rest using Lux, assuring that they can

provide documentation on data collection rules and obscuring options ([00:30:58](#)) ([00:48:54](#)).

- **Deployment Workflow and Satellite Capabilities:** Jason Anderson inquired about Blue Yonder's current deployment workflow, which uses Service Now calling an Azure function that triggers an on-premise AWX instance ([00:34:17](#)). Jason Anderson highlighted that Satellite includes automation features for deployments to VMware and cloud environments, a capability the hybrid console lacks, suggesting the team consider their deployment frequency and destination ([00:35:24](#)).
- **Subscription Management and Integration Steps:** Dana Singleterry confirmed that the team is using Simple Content Access with Satellite 6.17, which relaxes enforcement for growing and shrinking their Rail footprint ([00:36:29](#)). However, to monitor consumption via the Subscription Watch tool, clients must enable Insights, and the cloud connector must be enabled between Satellite and Insights to pass consumption data to the console ([00:37:37](#)) ([00:47:02](#)).
- **Reporting Features and Version Locking:** Manny noted that the vulnerability and compliance reports available on the Red Hat Console security tab are not available in Satellite. Manny also asked about version locking in the console, to which Dana Singleterry confirmed the ability for versioning using content templates, though it is more simplistic than Satellite's implementation ([00:40:41](#)).
- **Future Satellite Updates and Containerization:** Dana Singleterry informed the team that Red Hat is containerizing components like vulnerability and compliance from the SaaS solution to bring them to on-premise Satellite for air-gapped customers ([00:41:42](#)). Satellite 6.20, expected in the fall, will be a containerized product to ease high availability, though the Puppet-driven installer will remain the same ([00:42:49](#)).
- **Next Steps and Follow-up Demonstration:** The team agreed that a full life cycle demo, using a combination of SaaS and on-premise tooling, would be helpful, and they will schedule a follow-up meeting in two weeks with Billy, the SSA who was on PTO ([00:45:15](#)). Jason Anderson suggested that configuring image builder to auto-register systems with Insights at build time could automate the collection of subscription data ([00:52:00](#)).
- **Azure VM Licensing and Subscription Transfer:** Ira Fox raised concerns about purchasing Red Hat subscriptions for Azure VMs and the potential for expensive pay-as-you-go models ([00:54:27](#)). Jason Anderson confirmed the availability of a "bring your own subscription" model for Azure, requiring users to join the cloud access program and manually point their gold images to the on-premise Satellite server for repos instead of Azure's default repositories ([00:55:39](#)).
- **Discussion on BYOS Licensing for Azure Deployment:** Dana Singleterry confirmed that the Bring Your Own Subscription (BYOS) concept involves purchasing and deploying golden images on-premise, which can then be deployed to Azure through the cloud access program. Ira Fox noted that this

setup requires purchasing a single two-socket server license, which accounts for two virtual machines (VMs), and they stated this is expensive compared to their current approach for VMware. Dana Singleterry suggested that their account executive, Bill, has creative ways to make this arrangement economical and favorable for the client ([00:58:20](#)).

- **Setting Up a Follow-Up Meeting for Life Cycle Discussion:** Dana Singleterry proposed scheduling a follow-up meeting in a couple of weeks to include Billy and discuss the life cycle topic. Ira Fox suggested the week of the 23rd or 27th for the meeting, and Manikandan R confirmed their availability ([00:59:20](#)). The team confirmed they are in the Eastern time zone, which facilitates better scheduling for their ISTD colleagues, including Manny in the Indie office, even though it is 9:00 p.m. for them on a Friday ([01:00:12](#)).
- **Scheduling the Follow-Up Meeting and Quarterly Check-ins:** Jason Anderson proposed Wednesday the 25th for the follow-up meeting, which Ira Fox and Dana Singleterry agreed upon. Jason Anderson and Ira Fox settled on a meeting time of 9:00 a.m. Eastern Time, noting that an earlier time is better for the junior staff members ([01:00:12](#)). Jason Anderson also asked about setting up a quarterly call for Red Hat-related updates, which Ira Fox affirmed they would like ([01:00:55](#)).
- **Discussion on Kubernetes and OpenShift Preference:** Jason Anderson inquired about Ira Fox's projects, specifically their use of Kubernetes. Ira Fox expressed disappointment that they were unable to use OpenShift, despite having taken training and having a personal liking for it, because their product development team chose Microsoft's Kubernetes service (AKS) ([01:00:55](#)). Ira Fox favors OpenShift for its ability to run the same environment on-premise, in Azure, and in AWS, which addresses the lack of standardization across different Kubernetes platforms ([01:01:53](#)).
- **Red Hat OpenShift Capabilities and Transcript Distribution:** Ira Fox commented that OpenShift handles virtualization but noted its limitations with older Windows servers. Jason Anderson and Dana Singleterry confirmed that OpenShift is better suited for modern Windows environments. Dana Singleterry suggested that they send the PDF documentation to Jason Anderson, who will combine it with the transcript to send a single follow-up email to Ira Fox and Manny to avoid spamming them ([01:02:50](#)).
- **Finalizing Meeting Logistics and Industry News:** Jason Anderson agreed to send out the meeting invite for the 25th at 9:00 a.m. and confirmed they would set up the quarterly call ([01:02:50](#)). Ira Fox mentioned industry news that Susse is up for sale again, which sparked a brief discussion about Novell Network and its acquisition history. The team acknowledged that the private equity firm EQT is reportedly exploring a \$6 billion sale of Susse ([01:03:48](#)).

Suggested next steps

Jason Anderson will send the transcription and notes of the call to Ira Fox for sharing with other folks.

Dana Singleterry will send Ira Fox and Manikandan R documentation on (1) the data being collected by Insights to help gain cyber security team approval, (2) the core features slide deck, and (3) the standard operating environment information including image mode.

Ira Fox will send out a Teams invite for future meetings if it is preferred for convenience.

Dana Singleterry will bundle the deck into a PDF and send it to Ira Fox and Manikandan R for more clarity on the general management deck to decide between Insights and Satellite.

Jason Anderson will set up a follow-up meeting with Billy for a life cycle discussion on Wednesday, the 25th, at 9:00 a.m.

Dana Singleterry will include the thought that escaped in the email follow-up with some slides and documentation for Ira Fox.

Jason Anderson will set up a quarterly call to catch up on anything Red Hat related.

Jason Anderson will send the PDF documentation from Dana Singleterry to Ira Fox and Manikandan R, along with the meeting invite.

You should review Gemini's notes to make sure they're accurate. [Get tips and learn how Gemini takes notes](#)

Hybrid Cloud and Satellite - Transcript

00:00:00

Dana Singleterry: I got you. What about Bill?

Jason Anderson: Uh, Bill's right outside of Philly. Was it King of Prussia, I believe.

Dana Singleterry: Oh, okay.

Jason Anderson: So,

Dana Singleterry: You guys still experiencing some uh pretty cool weather?

Jason Anderson: man, how do I put this? Let's see. Thursday it was 85°. Friday, we had 2 in of snow. or excuse me, Wednesday it was 85 degrees. Thursday we had 2 in of snow and right now it's about 50° outside.

Dana Singleterry: That crazy, man. That is crazy. Yeah.

Jason Anderson: Oh,

Dana Singleterry: I mean, we we certainly have had some heat here and um I guess it was yesterday storm blew through and it's sitting at about 50 here right now. I think it's going to get on up to mid70s, but uh yeah, it's interesting.

Jason Anderson: nice.

Ira Fox: Hey,

Dana Singleterry: Hey,

Ira Fox: it's testing the audio.

Jason Anderson: Yes, sir. We hear you good loud and clear.

Ira Fox: All right.

00:01:05

Dana Singleterry: you got anybody else joining on your

Ira Fox: Yeah,

Dana Singleterry: side?

Ira Fox: Manny should be joining. It takes a while when we connect to Google because we're we're primarily teams for video

Dana Singleterry: Gotcha.

Ira Fox: chat and then sometimes we get on Zoom.

Jason Anderson: Uh

Dana Singleterry: Yeah, we use just about everything,

Jason Anderson: well,

Dana Singleterry: but primarily the the Google

Jason Anderson: absolutely. But if it's more convenient for you,

Dana Singleterry: platform

Jason Anderson: Ira, moving forward, uh if we want meetings, um I I can ask you to send out a team's invite and we can jump on them that way if that's preferred.

Ira Fox: We probably should do that in the future just because we we're one of those companies that pays all that money for co-pilot. But it is it is nice to have the AI summarized for our calls.

Jason Anderson: Believe me, that's why I love uh Google if we have Gemini. So, uh if you want, I can send you the transcription and notes of the call today after if you would have

00:01:55

Dana Singleterry: It

Ira Fox: I would appreciate that so I can share that with other

Jason Anderson: if not a problem.

Ira Fox: folks.

Dana Singleterry: looks like you might have it on already,

Jason Anderson: Yes,

Dana Singleterry: Jason.

Jason Anderson: I I've already turned on the note takingaking uh for this call.

Dana Singleterry: Awesome. Well, um I I'll let you uh drive us,

Jason Anderson: Yeah.

Dana Singleterry: Jason. Um it sounds like we got another person on on our side and and I thought Bill was going to

Jason Anderson: Yeah.

Dana Singleterry: join.

Jason Anderson: Uh I don't know if Bill's going to be able to or not. Um, where's the plus? I hope I didn't just kick him out.

Dana Singleterry: It said he could now join the meeting. I'm not sure. Maybe. Okay,

Jason Anderson: There he is.

Dana Singleterry: there he is.

Jason Anderson: Hello.

Ira Fox: We all have the same issues.

Jason Anderson: Ah.

Manikandan R: Oh,

Ira Fox: I I I really wish it was an industry standard that all these video conferencing tools had to

00:03:01

Dana Singleterry: I know,

Ira Fox: follow.

Dana Singleterry: right? Yeah, they all have their nuances for

Ira Fox: Well, the worst is Zoom defaults to some audio device and Google defaulted to the the

Dana Singleterry: sure.

Manikandan R: that's f

Ira Fox: the Windows speaker instead of the

Jason Anderson: something out. Yeah.

Ira Fox: headset.

Jason Anderson: Um so I just want to go ahead and you know kick us off. Uh it's nice to meet you guys virtually. Uh this is the first time I've ever uh spoken with you. Uh but my name is Jason Anderson. I am the solutions architect. Uh I support Bill Vanilla. He is the account executive uh for Panasonic which obviously uh leads down to Blue Yonder. Um so I've been with Red Hat for going on four years. Uh, previous to that, I did 14 years in the research and development side for the FAA. So, I got to play with all of the cool Red Hat tools and learned all the platforms and then decided, you know what, it's easier to talk about it than it is to do it and came over to Red Hat.

00:04:10

Jason Anderson: So, that is the short and sweet about me. Um I have brought Dana here who is am e for all things Roland satellite. So um you know Dana if you introduce yourself and then I gonna I heard him say Manny so I hope that's okay for me to

Ira Fox: We call him Manny for

Jason Anderson: say okay.

Ira Fox: short.

Manikandan R: Yeah, that's correct.

Jason Anderson: Yeah I wasn't gonna I wasn't gonna even try

Dana Singleterry: sounds good. Well, thanks for the uh intro, Jason. Um, yeah, name is Dana Singleary. I'm a rail specialist. You can call me a a subject matter expert.

00:05:06

Ira Fox: All right.

00:06:06

Manikandan R: Um yeah hi I'm money man money man money man money man money man money man money man money man money man money man money man money man moneyan you call me as money yes I'm handling that uh uh that infrastructures like uh

unique storage backup and as well as some automation platform Azure stuff uh some kind of devops yes I'm in blender around uh more than 10 years. Yes, that's for my

Ira Fox: Cool. Yeah. So Manny and I are although we we're all in the same IT infra.

Manikandan R: Yeah.

Ira Fox: So first before I introduce myself, let me give a lay of the land. It bleonder has two different groups that kind of use Red Hat. Um we have our cloud delivery team which runs production customers right both hosted and of course now we have a lot of new cloudbnative solutions running in Kubernetes and Azure um Manny and I work in the IT infra so we support all the company so that means development support sales services you name it finance legal all everything from all the infrastructure that they're using to do all the back office things, that kind of stuff.

00:07:29

Ira Fox: Um, but where Red Hat comes in on the IT side is that even though we do have a lot of new cloudbnative offerings, all of our core products all run on rail and Windows and still AX in some cases and even Solaris and HP UX, believe it or not. So man Manny and I kind of or are kind of like the lead engineers for Unix, anything Unix, anything Linux, anything storage relo um I have a lot more lead in the Azure space because I'm doing a lot with Kubernetes. Um but I've been using rail before it was ever like when it was still shipped out on floppy.

Dana Singleterry: When you got when you got Yes.

Ira Fox: in the early days and I had many many fights with some mainframe systems managers

Dana Singleterry: Yeah.

Ira Fox: that Linux will will definitely be the de facto operating system in the future. Um this was in the early days of Linux when you could build it with Slackware and then Red Hat introduced their first distribution. So um I've been doing it a long time as well.

00:08:40

Ira Fox: Um, I love technology. So, like I say, all of our stuff and I don't know if you guys have looked at what what it has for Red Hat. Um, we primarily have a production cluster. I know it's not massive like companies that do nothing but Red Hat, but we have a we have a large VMware production cluster that runs build servers, you know, product build servers, anything that's that's not deemed internal development. And then we also then

have the internal the de D de D de D de D de D de D de D de D de D de D de D4T if you will as Red had called it at the time and in their attempts to cover up their their fooar with CentOS.

Dana Singleterry: Yep.

Ira Fox: Um and that was great that's fine you know.

Dana Singleterry: That was a That was a bitter one for

Ira Fox: So all of our internal development all of our internal development both in Azure when

Dana Singleterry: sure.

Ira Fox: it comes to VM traditional VMs as well as on prem use that license.

00:09:42

Ira Fox: I would imagine um that would be a really big shift if if we had to pay production licenses for all these internal developers.

Dana Singleterry: Well, that that's the idea of you know the uh developer um licenses is based on your you use case and you know if you have a lot of uh developers you know you can go with developer for business

Manikandan R: This

Dana Singleterry: um and you can go self-support if you want or you could get premium support if you

Manikandan R: is

Dana Singleterry: not um you know those are those are your options and it sounds like you know there's there's no issue with that with you guys.

Manikandan R: done.

Dana Singleterry: I mean you know you tell us that you're using it in a development environment and then you're pushing it out to a production environment where you're running you know rail VMs or VDC's or

Ira Fox: Yeah.

Dana Singleterry: whatever. Um that's that's the intent of the uh the new developer SKUs.

Ira Fox: Yeah. So, um right now we're currently using just a single satellite server and managing use it primarily for rail entitlement management, you know, for the Vert who for for VMware.

00:10:56

Ira Fox: Um, but you know, with some of the enhancements and whatnot in the last three years or so,

Dana Singleterry: Yep.

Ira Fox: you know, Manny and I decided maybe it's time to take a look at what we can and can't do with the newer, I guess you would call it hybrid console.

Dana Singleterry: Right.

Ira Fox: There's any new features or is it really the same thing and we should just stick with satellite, you know.

Dana Singleterry: Yeah.

Ira Fox: And then of course, you know,

Dana Singleterry: Well,

Ira Fox: we have real 10 now starting to work on deploying real 10 because developers want that now.

Dana Singleterry: right.

Jason Anderson: All

Ira Fox: And um that that goes into just you know that also goes into some of the other

Jason Anderson: right.

Manikandan R: That's

Ira Fox: aspects of man's job and that's automation and utilizing AI and and that's a lot right but what I don't want you to try

Jason Anderson: Okay. I

Ira Fox: to sell me is anible automation because we can't afford

Jason Anderson: I

Dana Singleterry: What are you guys what are you guys doing for automation right now?

00:11:45

Ira Fox: it.

Dana Singleterry: Because that that is a pretty broad topic, right?

Ira Fox: So we have a lot of anible playbooks and Terraform that we either control through a pipeline through GitHub actions or we use what's called AWX.

Dana Singleterry: Gotcha.

Jason Anderson: f***

Dana Singleterry: So you're using the community version of AWX of Anible,

Ira Fox: Well there yeah there is only a community version and obviously there's some risk right now because it's being refactored

Dana Singleterry: right?

Ira Fox: right now.

Dana Singleterry: Yeah.

Ira Fox: Um I unfortunately Anible automation is just too expensive there.

Dana Singleterry: Gotcha.

Ira Fox: There's no one you can prove that it would cost we could get ever get a return on investment. And I've seen every IBM and Red Hat PowerPoint and none of them can prove that that you could convince our our business managers or leaders

Dana Singleterry: Yeah.

Ira Fox: otherwise.

Dana Singleterry: Well, I'm I'm certainly not going to try and uh sell you on on anible. I I do

Ira Fox: Ju just so you know I I I when I started app hosting back in 1999

00:12:44

Dana Singleterry: I

Ira Fox: was right before Y2K my man my manistics the company that I originally came from before JD acquired us and then now Pantock acquired JDA um the big thing was you know we're

Dana Singleterry: Yeah.

Ira Fox: only you know was only they were only going to have one system go which was me so they oh if we purchase Unicenter and this is what the sales guys said oh you can automate everything you can self-learn yeah they were long.

Dana Singleterry: Gotcha.

Ira Fox: So, long story short, it it's not going to reduce when you already have a very small team. All right. So, proactively, some of the things we're looking for is option. What can we do? I mean, the team just started playing with the uh image builder a little bit. um just because we need CIS hardening and some of the open- source community supported repos out there have not caught up to real 10.

Dana Singleterry: Are you using uh image builder on the console or with rail or with satellite? What are you doing there?

00:13:54

Ira Fox: Uh, these just went to the um the

Dana Singleterry: Gotcha. Yeah,

Ira Fox: console.

Dana Singleterry: because it is integrated with I mean it's shipped with rail. Um it's integrated with with uh insights on the console. It's integrated with satellite. So yeah, it's always good to know how you're you're going about doing that.

Ira Fox: I mean, um, the version of satellite, we're pretty current, aren't we?

Manikandan R: Yes, we have a latest I think I'll give that exact uh that information. It is yeah 617

Dana Singleterry: 613.

Manikandan R: I think now 617.

Dana Singleterry: Oh, 617. Gotcha. Good. Well, you're you're supported.

Manikandan R: Yes.

Dana Singleterry: Yeah, the uh current versions are 616, 17 and 18. Um 19 comes out here in another few months. Um and and then 20 um towards the end of the year. they are working. Well, there is a provided long life offering with satellite right now as well. I forget which version it is. I want to say it's uh it's 618, but but if that's something that you're interested in so you don't have to do the upgrades every every 18 months.

00:15:06

Dana Singleterry: Um we could talk about that at some point as well. But uh but it sounds like you know you want to know okay will insights the cloud console um will it do everything that satellite does for us today or should we stay with satellite is that is that the kind of the highle summary Ira and

Ira Fox: Well,

Dana Singleterry: Manny

Ira Fox: today we are only using satellite for a very small functionality. Um, and we we opted for image builds using like what's called packer,

Dana Singleterry: using packer.

Ira Fox: right? However, you know,

Dana Singleterry: Okay.

Ira Fox: we also have another challenge which is um operating system patching. you know, pre our previous leadership, we were just building anible inventories and, you know, running updates that way. Um, but that's not necessarily effective when you have to reduced produce um compliance reports for security. Um,

Dana Singleterry: Yeah.

Ira Fox: so one of the my my my dream and I don't I'm guessing I don't think it's there yet and this is something I had talked about with our previous Redhead probably from

like four or five years ago.

00:16:26

Ira Fox: Um was want to have a SASbased solution that provides a mechanism to have like the satellite servers. Um what are the Manny what are the we we haven't used them what is the

Dana Singleterry: Capsules.

Ira Fox: uh spoke of a satellite yeah capsules something like that

Manikandan R: Hey.

Ira Fox: where the the console if you will would the SAS if you will app would

Manikandan R: They are not using

Ira Fox: would be the control and you would have onrem capsules if you will if that's the

Manikandan R: now.

Ira Fox: terminology and it doesn't sound like it's there yet and I don't know

Dana Singleterry: Yeah. So, so they do have a a a new thing that was launched I want to say it was uh mid last year and you could s suggest that it's somewhat similar. It's called a proxy. Um, and that proxy, the idea is that it provides better security or better comfort is probably the the the best word to use for those customers that struggle with getting a SAS solution approved. Um, there's still a connection obviously to the console, but the connection is through the proxy, not through the hosts themselves.

00:17:39

Dana Singleterry: So it gives you an an extra layer or or barrier um of of security there. So that is available. Um that does not work anything like the the satellite capsules. The the premise with the capsules is in you know low latency type situations. Um you can put that capsule closer to your you know your your your data center if it's on premise. you can put the capsule um in one of the hyperscalers you know whether it's AWS Azure whatever um and ideas that the content resides on that capsule it is proxied through um on on many occasions through the satellite server but the satellite server can just share metadata and then that capsule can go back to the CDN and pull down content and the further idea is that in a a uh

Ira Fox: Right.

Dana Singleterry: um a situation where your satellite server may go down for whatever reason, well, the capsules can continue to do everything, you know, patching, you know,

um creating your your content views, composite content views, your life cycle environments. The only thing that it can't do is register new new systems.

00:19:01

Dana Singleterry: That that has to take place with the satellite server. So once again, the idea is that, you know, the the the capsules give you a little bit of redundancy. Um they can be load balanced. Um and they get that content closer to those uh devices that it's serving.

Ira Fox: Yeah. So the the dream would be that there would be some type of proxy capsule functionality so that all 2,000 rail VMs have to

Dana Singleterry: Yeah.

Ira Fox: go out the internet to pull patches.

Dana Singleterry: Right. And and that's, you know, honestly, I I can throw up a slide here real quick and and I'm not going to do a bunch of slideware or anything like that, but just give you a quick um overview of um when you would want to use satellite versus um when you would want to use um insights. And let's see, bring the call back here. Can you see my screen by chance?

Ira Fox: Yeah.

Manikandan R: Yeah.

Dana Singleterry: You can. Okay.

Ira Fox: Yes.

Dana Singleterry: And I could bundle this deck up for you here.

00:20:06

Manikandan R: Yes.

Dana Singleterry: This is um it's a little bit outdated. Um but this is our um general management deck um to help you decide will insight serve the use case that I have or will satellite be a better uh solution for me. the the the big thing with satellite I would say and I'm not going to read this to you but I'll just uh I'll leave it up here so you can look at it and and then I can bundle these up into a PDF and send them to you for a little bit more clarity. um satellite itself, you know, we we have customers across the board, whether they're, you know, uh public sector, you know, government entities or or private businesses um leveraging satellite and a lot of enterprise uh customers such as, you know, at um they have hundreds of thousands of clients out there. So the way they do it

is they have a master satellite and beneath that they have I think I want to say it's like five maybe 10 satellites and then you can imagine it just grows with capsules because you know they're they're all over the world in that that telco space.

00:21:20

Dana Singleterry: Um so it can get very complicated very very quickly. But the other thing is you know like I said earlier a lot of customers their security departments just won't let them use a SAS solution for you know things that are highly secure you know sharing IP addresses and things of that nature right I and that's where satellite comes in but the other thing with satellite and I already mentioned this is you know the idea behind uh you know low latency or or low bandwidth situations and that's where the capsules come into play and That's something that's not available with insights. Um, and then insights is primarily working with with images. Um,

Manikandan R: All

Dana Singleterry: and you know the new thing is you know managing images like containers with image mode that came out in rail 10 and you can you can do that with image builder um you know whether you're using it standalone satellite or insights. But then with satellite truly probably the the biggest sweet spot of it

Manikandan R: right.

Dana Singleterry: is um the content facility which the upstream there is called pulp 3. You can you know go to github and get all the details on that.

00:22:34

Dana Singleterry: Um that said insights is also using pulp 3 um as a content tool. it just has not um implemented and there is no plan for them to implement the more complex um um content crafting if you will uh facilities that are provided within within satellites implementation. So you kind of have to balance you know how advanced is your life cycle management scenario is it just you know you have a development environment you have a quality assurance environment you have a production environment and you're rolling versions from dev to QA to production on I don't know maybe a monthly basis maybe a quarterly basis but you know that's every customer is different there can insights do that it does have you know very basic life cycle management uh facilities. It does have very basic host grouping facilities so you can apply it towards a group of hosts but I would argue that the sweet spot for insights is the advisory the vulnerability

um the the drift analysis things of that nature um it's just a much better tool than what satellite has to offer.

00:23:56

Dana Singleterry: Both of them are using openscap for vulnerability. It's just that insights is honestly a better implementation in my opinion and that's coming you know from the former product manager where we were considering ripping ripping that out of satellite at one point and just saying hey customers integrate satellite with insights and you're going to use the compliance tool provided via uh insights. The only reason we didn't rip it out is because of those disconnected, you know, air gap customers. Um, they they need a compliance tool and they're they're never going to be able to use insights or at least that's what they tell us today. Now, we do have a Fed ramped um offering in Amazon of Insight. So, that is helping to combat that that concern that some of those um um disconnected, you know, government entities have. So hopefully that kind of gives you an idea um of of the difference between the two. There's a lot more information in these slides here and like I said, I'll I'll I'll bundle that up in a PDF and send it to you.

00:25:02

Dana Singleterry: But um it really comes down to what what it is you're trying to do. One other thing that I'll show you here really quickly and this is something that is not easily um accomplished with um with insights itself. Let's see. Let me scroll down and just select a slide here. All right, here we go. Let's start with this. So, and and first off, are are you from how do you do your life cycle management right now? Do you have a similar setup as you know a production a QA in a development environment?

Manikandan R: Uh as of now if you ask uh we are not maintain any kind of thing. All the machines we consider as a development and we are updating like that.

Dana Singleterry: Okay.

Manikandan R: So everything we are updating to that the same guy and yes completely 100% of service will be in the same patch level. We are not distinguishing we are not applying that first uh development QA production. No not like that.

Dana Singleterry: Gotcha.

00:26:08

Dana Singleterry: Okay. Well, what I'm showing you here, you know, customers do things different. I'm not I'm not saying that one is right or or better than the other, but best practices when you're deploying um or provisioning or patching at scale is, you know, have a development environment where you're you're building things out. Have a QA environment where you're testing things out and then when you're com comfortable, you push it to production. And so you know the idea here is let's say you know you are um building your your V3 in development right now um but V2 is in QA and then V1 is your current production. And you could see how you know just kind of stepping through this. Oh we got animation here. I forgot I had all that. I'll go through it quickly. Okay. You can see that um stepping through this you know how you you slowly progress this you know through your your pipeline to those new environments. So here, you know, showing that development is now version five, QA is version four, and production is version three.

00:27:23

Dana Singleterry: And you know, I know you're you're not you're not interested in AAP. You can do this with AWX. Satellite will integrate with that. And you could use AWX to automate this promotion on whatever cadence that you want such that you don't do anything. It's just going out there. It's getting the content. It's getting the patch sets. It's building these for you based on the content views and composite content views that you've built and applied to host groups. And then you're just sitting back and and waiting for it to uh give you the workflow of success or failure or you need to look at so and so you know um and that's the idea of how how this this you know automation using anible with satellite works. And then one other thing that you can do is I I mentioned integration with insight. So that's really the trifecta of of the management tools. Um, insights is a great place for just looking at those vulnerabilities, applying the remediations directly from insights to the clients or if you have a satellite in in the picture down through satellite down through the capsules and then to the the hosts that need uh patching, remediations, whatever um it may be.

00:28:48

Dana Singleterry: I said a lot. I'll I'll just stop there and see if you have any questions um

right now.

Ira Fox: Yeah. And this kind of stuff right here is this oldfashioned satellite stuff. Not oldfashioned, but tra traditional satellites been doing this for quite a while having that capability.

Dana Singleterry: long long time. We did this back in the satellite 5 days.

Ira Fox: Um, well, we're just trying to figure out, honestly, we're just trying to figure out what what the new the newer rail enterprise

Dana Singleterry: Yeah.

Ira Fox: Linux function on the hybrid console cloud console, what it can do versus what satellite. And it sounds like, you know, in the past, Red had a hard time separating the the um what do you call it? the entitlements that are on prem versus what you do directly to a Red Hat console.

Dana Singleterry: Yeah,

Ira Fox: The red the Redhead network basically is what they used to call it back in the

Dana Singleterry: we we Yeah, we we have figured that part out.

Ira Fox: day.

Dana Singleterry: Um and and this is I mean, you're familiar with what this looks like.

00:29:54

Dana Singleterry: It sounds like you're you're dabbling and playing around with it some at this point, but um you know, specifically what we're talking about is is management of rail, right? And so, have you have you looked at your um your dashboard to see, you know, what's going on or have you connected any of your your systems to insights at this

Ira Fox: No, because that that was the one thing that we needed to kind of get a better understanding of.

Dana Singleterry: point?

Ira Fox: Um because insights is collecting data on the VMs. Um we hadn't at the time, you know, before the before we started really getting into observability, you know, with Elastic Search and and other tools like it. Um, and then the AI of course kicked in all the the AI buzz.

Dana Singleterry: Yep. Yep.

Ira Fox: Um,

Dana Singleterry: It's

Ira Fox: what what what I need to what we need to do is figure out what data insight or now

Dana Singleterry: everywhere.

Ira Fox: live whatever it's called lifelight or flashlight. Quit changing your name.

Dana Singleterry: Call it insights.

00:30:58

Ira Fox: Insight.

Dana Singleterry: Yeah, it's they renamed it to Lightseed like a month or two ago and I honestly I was talking to the uh senior director who used to be my manager um and he's like yeah this was a

Ira Fox: It's

Dana Singleterry: marketing ploy because everything we're doing is light speed now. I'm like it's just confusing you know.

Ira Fox: not light speed if you're going across a slow internet connection.

Dana Singleterry: Yeah, right.

Ira Fox: So understanding that what kind of data it collects um

Dana Singleterry: Yeah.

Ira Fox: will help us to be able to get approval from our cyber security

Dana Singleterry: So, what I can do for you there,

Ira Fox: team.

Dana Singleterry: I'm going to send you a um a some documentation on this and I I will um I will pick out the documentation specifically on the data that's being collected. Um I did pull this up ahead of time. There's a heck of a lot of stuff out here, but the the main thing to know is that the data is is highly encrypted. Um and it works very similar like like it does in satellite.

00:32:01

Dana Singleterry: Um in insights um the data is encrypted on the host system before it's being sent. So it's ensuring that only authorized information is transmitted. Then in transit all the communication between the host you know the the rail host

Jason Anderson: Sorry.

Dana Singleterry: itself and and our console it's secured via TLS and that's utilizing a mutual uh two-way authentication with digital search and you know you get it you get the idea there. So that prevents uh you know interception of it. Then at rest uh we're using Lux which is you know the Linux unified key setup for for encryption of that information and then the data integrity piece of this we sign every you know piece of

those the data collection rules and if the signatures can't be verified the whole process is aborted but we've got all that very well documented and the other thing that you can do is you can obfuscate data like you know you don't want to send the IP address you don't have to send the IP address, you know, um that does help a lot, but there there's ways around that because the MAC addresses, for example, could still be shared um and so forth.

00:33:15

Dana Singleterry: You you still have to have a way of identifying that host such that when you're applying a remediation, it knows which host or host groups to apply it to, you know. So, like I said, I can I can share that documentation with you as well. I will share the uh the core features um slide deck. Like I said, a little bit outdated, but it's still it's still accurate. Um and then if I were to just come over here and look at the the dashboard itself, um you get this with open shift, you get this with anible, but we're talking about rail and you know it just you know you can see that mine mine is a mess here and this is just bogus data anyway. Um, but heck a heck of a lot of uh CDEs here and by CDE score or CDSS score, you know, it tells you your vulnerabilities, your your recommendations by total risk. Um, a lot of information like that. Yeah. Was there a question there?

Ira Fox: Um,

Dana Singleterry: Sounded like somebody was trying to ask a question.

00:34:17

Ira Fox: Manny,

Dana Singleterry: Maybe not.

Ira Fox: maybe not.

Dana Singleterry: Maybe not. Okay. I I was just hearing some background noise there. Um, but if I were to jump jump into this,

Ira Fox: Sure.

Dana Singleterry: did it say that again?

Jason Anderson: I just said one one minute. Uh, Ira, can I jump in and ask a question real quick?

Dana Singleterry: Okay.

Jason Anderson: And I I just want to understand your workflow a little bit better. You

said you're deploying systems to multiple spaces, uh, VMware cloud. Um, are you using the same how how are you deploying those systems, I guess, is what I want to know.

Ira Fox: So at a high level we have a REST API function defined in Azure that allows service now.

Jason Anderson: Mhm.

Ira Fox: So when a user wants a new VM to go into our service now go to the catalog item new VM it makes an REST API call via the Azure function to our AWX instance on prem and calls a certain workflow.

Jason Anderson: Mhm.

00:35:24

Ira Fox: if you're familiar with Anible.

Jason Anderson: Yeah. No.

Ira Fox: Um and then and so that that pro that sets up the provision of the VM

Jason Anderson: So all of the

Ira Fox: and and the you know the registering and reapplying any type of say yes policies

Jason Anderson: other stuff.

Ira Fox: they have to be done post deployment things like

Jason Anderson: Okay.

Ira Fox: that.

Jason Anderson: So I mean the only reason I ask and no I'm not trying to sell you anible is because satellite has that functionality. So within satellite, you can set your automation to do your deployments to your VMware, to your cloud, to all those different environments. That's something that you can't do from the hybrid console. Um, so I would ask you to think about, and once again, nobody's asked you this question, how often you deploy stuff and where and how that goes. Um because you can't deploy to your on prem from the highway

Dana Singleterry: Yeah, great great point, Jason.

Jason Anderson: console.

Dana Singleterry: Thanks for bringing that up.

Ira Fox: Yeah, right now we're not using satellite for actual VM deployment.

00:36:29

Jason Anderson: No,

Ira Fox: Not saying we not saying we shouldn't.

Jason Anderson: you say

Ira Fox: Just saying we're not right now.

Jason Anderson: yeah.

Ira Fox: And we haven't. We we've only used honestly we've used satellite just for a glorified RPM repository and of course managing the actual entitlements themselves for

Dana Singleterry: Yeah.

Ira Fox: onrem.

Dana Singleterry: Yep. Understood. Um I presume that you Well, you're on 617. So, yes, you've enabled simple content access because that was uh enforced with 616 and are you familiar with that? I don't I don't need to go into

Ira Fox: I'm I'm aware that IBM wants to be able to collect money.

Dana Singleterry: too.

Ira Fox: So they change the this is to be able to identify it

Dana Singleterry: Well, no. So this yeah this was a this was a Red Hat thing before the IBM

Ira Fox: better.

Dana Singleterry: days. It's been around for a long long time. But the idea is that with simple content access, it relaxes enforcement such that if you have one entitlement or one subscription in your manifest, you can grow and shrink your your um footprint on the fly without having to call up your AE and say, "Hey, I need another uh rail license." Now,

00:37:37

Dana Singleterry: it does require that you keep an eye on it. And if you're registering those systems um via satellite to insights um or you're just registering them to insights, you have the tool subscription watch to see what your consumption looks like at any

Ira Fox: Yeah.

Dana Singleterry: time.

Ira Fox: And that's the one thing that still doesn't work too well is like when you look at our satellite or um our what you call it insights the Red Hat network portal and you look at

Dana Singleterry: Yeah, when I say insights,

Ira Fox: subscriptions.

Dana Singleterry: I'm referring to the SAS solution

Ira Fox: Yeah.

Dana Singleterry: console.

Ira Fox: When you when you look at the Red Hat subscription portal, it only sees that our satellite server is registered.

Dana Singleterry: So what you have to do there is enable insights on your clients and then you have to enable the cloud connector within satellite and that allows that information to pass through satellite to uh the console. So it is a multi-step process to to get all that integrated. It doesn't happen just um via straight up installation of satellite.

00:38:49

Dana Singleterry: Um you you do have to go through a you know I don't know it's they say it's a push button.

Ira Fox: Yeah,

Dana Singleterry: I think it's really a few steps.

Ira Fox: you see this is why I wanted I was hoping that Red Hat would have come up with what we kind of talked about five six years ago. let the SAS portal be the front-end control plane and people want to deploy in Azure cuz I don't know may maybe it's I can't imagine it's just yonder and Panasonic but you know we don't allow VMs to touch the internet directly we do allow some things to go but it has to be

Dana Singleterry: Right.

Ira Fox: approved so like any OS patching any of that stuff gets pulled down locally from a

Dana Singleterry: Yeah.

Ira Fox: in this case satellite I mean,

Dana Singleterry: Right. Right. No, I I get that. And that's

Ira Fox: even my containers,

Dana Singleterry: that's

Ira Fox: you know, although I still allow it because I need to pull things once in a while from Docker, everything comes from a private container

00:39:40

Dana Singleterry: Yeah. Yeah.

Ira Fox: registering.

Dana Singleterry: and and I don't know if you're aware of this, satellite can manage uh you know pushpull of of of containers, Docker um so that is built into the product as well. So there's a lot of lot of stuff built into it that um it sounds like you got other tools that are doing that work for you right now. So you know not suggesting that you change that but um there's certainly a lot more functionality in satellite that could simplify um your your workflows most likely. So something to keep in mind.

Ira Fox: All right. So, one of the other pieces that I was more interested in in Manny,

Dana Singleterry: Um,

Ira Fox: I even actually looked at satellite to see what it has in the way of vulnerabilities and compliance reporting. In the old days, it was very manual, but looking at the functionality when you click into the security tab on on the Red

Manikandan R: See?

Ira Fox: Console,

Manikandan R: Mhm. Mhm.

Dana Singleterry: Oh, you want me to do that for you real quick?

00:40:41

Manikandan R: Okay.

Dana Singleterry: Yeah.

Ira Fox: you know,

Dana Singleterry: Yeah.

Ira Fox: between the vulnerability and compliance and all those reports

Dana Singleterry: Yep.

Manikandan R: This is this is nice things because this is not available in this satellite I believe. Yeah. See, see. Okay. Apart from

Ira Fox: So if we connected if we if we did enable insight data to be collected on all our VMs,

Manikandan R: that,

Ira Fox: I would imagine that would show up here.

Dana Singleterry: It would absolutely show up here.

Ira Fox: Correct.

Manikandan R: see,

Dana Singleterry: Yeah.

Manikandan R: see, apart from all the other stuff, just I want to ask one simple question in this console. Can we do the um version locking? It's possible.

Dana Singleterry: Say that one more time, Mandy. I I didn't

Ira Fox: Oh,

Manikandan R: It's a version locking.

Ira Fox: you're talking about under under content Thank

Dana Singleterry: understand.

Manikandan R: Yes.

Ira Fox: you.

Manikandan R: The thing is suppose I want to log some machines to only 9.6 or only 9.4 something like

00:41:42

Dana Singleterry: Oh, yeah. Yeah. So you you do you do have the ability for versioning um within

Manikandan R: that.

Dana Singleterry: the uh content facility here.

Manikandan R: Oh.

Dana Singleterry: It is it is it does work differently than than the way it works in satellite. Um it's working through these templates here building out multiple templates for example.

Manikandan R: Ah,

Dana Singleterry: Um yeah, so you can do that but it's and this is using you know the content management tool that satellite uses but

Manikandan R: okay.

Dana Singleterry: uh it's much more simplistic and you know they're they're they're not they're as far as I know from talking to the product team there are no plans right now to expand upon the functionality that exists here right now. what they're they're working on is um taking a lot of the components such that they can um containerize them and bring them down down to satellites. So the first one that they brought down was advisors. Um then they brought down um vulnerability. Now I believe they're working on compliance.

00:42:49

Dana Singleterry: And the reason that they're they're pulling these these down and

containerizing is a lot of customers that can't use this functionality in a SAS environment once again for security purposes. Um they still want it but they want it on prim and they they want to be able to control that. So that's something that is happening today and with 620 of satellite that comes out um in the fall time frame of this year,

Manikandan R: There we go.

Dana Singleterry: it's going to be a containerized pro product. So it's going to be easier to you know implement high availability with satellite for you know very u um highly available needs that that customers have.

Ira Fox: Are they changing are they changing the deployment methodology the way you install

Manikandan R: Oh,

Dana Singleterry: Are they changing the the wire deployment methodology? No,

Ira Fox: and deploy or

Dana Singleterry: the installer staying the same. Um that it it is driven by Puppet even though we have removed Puppet from the latest versions of satellite. The installer is still Puppet and you can still integrate with Puppet um externally either community or enterprise edition.

00:44:01

Dana Singleterry: But the main reason we removed that is because we've got Anible integrated within satellite. You know, you it can do all that configuration stuff that puppet did, but it can also do the automation um aspects of it and and playbook creation and anible core is also part of insight. So there are elements of of anible in both of these products. Jason, did you did you have anything you wanted to to add? I know I've been running my mouth a lot. I don't want to consume all the cycles because I know you had some some specific questions that you wanted to to get to.

Jason Anderson: Yes, but mine's more about the in, you know, a much broader topic. Uh, you know, not focused in on, uh, satellite per se, but, you know, to learn more about all your different environments that you kind of talked about earlier. Um, so I would take us way off track at this

Dana Singleterry: All right.

Jason Anderson: point.

Dana Singleterry: Well, we can we can certainly have a followup um as well and um do more of a full life cycle demo with uh the the um SSA that's aligned with me.

00:45:15

Dana Singleterry: He wasn't available today. So, I'm I'm doing a feeble attempt of uh going through insights. Um I don't have a satellite lab um anymore. I tore that down. I need to build it back up. But Billy um he's got all the components tied together and so he can show you that end to end workflow of best practices using combination of SAS and on premise tooling.

Ira Fox: Oh, that might be that that might be helpful. Manny, what do you think?

Dana Singleterry: Um

Ira Fox: See that? Maybe this where say yes or or no.

Manikandan R: Yeah.

Ira Fox: That's a stupid idea. I'm okay with either way. So maybe when when Billy gets freed up,

Manikandan R: Ah,

Dana Singleterry: He said he's he's just on PTO today.

Ira Fox: we can Oh,

Dana Singleterry: He said he could do it next week or at your convenience.

Ira Fox: I'm I'm I'm on PTO next week.

Dana Singleterry: So,

Ira Fox: my kid spring break. So, he's coming back from college.

Dana Singleterry: Gotcha.

00:46:08

Ira Fox: So, he and I are gonna do fun have some

Dana Singleterry: Okay. Awesome. Well,

Ira Fox: fun.

Dana Singleterry: maybe we plan that for like two weeks,

Manikandan R: we

Dana Singleterry: two weeks out. Um um if that works for you guys.

Ira Fox: That's fine.

Dana Singleterry: So, question for you. So, you've you've already looked at um building images. It sounded like you had built some images and and played around with this part of it right here.

Manikandan R: Yeah, we are doing some testing.

Ira Fox: Yeah.

Manikandan R: Oh, test. Okay, I'm not mute, right? Yes. Yes, we are doing some testing and then we are downloading and uh taking something and

Dana Singleterry: Gotcha.

Manikandan R: yes uh we are trying like this. Yeah.

Dana Singleterry: Okay. Okay. Um well, fair enough. Um this is subscription watch with my particular version right here.

Manikandan R: Uh-huh.

Dana Singleterry: I don't know what the heck's going on. It was working fine the uh the other day, but I do believe this is going to time out here.

00:47:02

Dana Singleterry: Um, so but but you're familiar with this and this is where you said it it you didn't think it was doing a very good job of counting your entitlements and yeah, graph display is unavailable. I have to see what's going on here. Um, the idea there once again is you you have to install or enable um insights on the client with rail 10. it it enables I don't want to say it enables it by default because that's you know not every customer wants to be sharing data but you do get prompted when you install a rail 10 um uh image to enable insights on that image but if you haven't done that then you have to go through and you could do this via a playbook against you know host groups or individual host hosts but once you enable that and if that host is registered to satellite. You have to enable that cloud connector between satellite and insights. Then those subscriptions would start showing up here for you.

Ira Fox: Okay.

Jason Anderson: And I know you

Ira Fox: So,

00:48:06

Dana Singleterry: So

Ira Fox: one of the one of the big things for us is identifying what data it actually collects, what data collects.

Dana Singleterry: gotcha.

Jason Anderson: sat.

Ira Fox: We'll have to identify that. I mean,

Dana Singleterry: Yeah.

Ira Fox: if it's simple things like IP addresses, I I'm not as concerned about that because it's all internal addresses anyway, but I don't want that obviously published in a public

repository.

Dana Singleterry: Right. Right. Uh

Ira Fox: But you know like some of our instances actually are running Oracle databases that the name of the

Dana Singleterry: let's

Ira Fox: databases happens to be the customer name which is not a great practice but we don't have control over what the

Dana Singleterry: So,

Ira Fox: DBA the developers do and the support folks do. So I clearly wouldn't want that information being propagated

Dana Singleterry: I'm going to bring Yeah. So,

Ira Fox: over.

Dana Singleterry: here's I I'll share this one with you as well um as soon as we get off the the the call. But this is um this is all about the data that is collected.

00:48:54

Ira Fox: Okay.

Dana Singleterry: It it tells you how it's put into an egg, the versioning of it, what is included in that egg, and so forth. Um, and then it also gives you some details on excluding data that you don't want to to be captured, um, and sent back and forth. So, um, I think this gives you pretty much everything that you're looking for. So, I'll I'll I'll share this with you. Um, I've got a few things here. I can share this one standard operating um, environment. The the cool thing about this one right here that you may not be aware of is uh image mode, which is this guy right here. And so with image mode, you think of u you know building images um and managing them like you do containers and and making image updates uh much like you do with containers. Um they are immutable images um easy rollbacks and all of that. And so this was introduced in rail 10. Um something that a lot of customers have been um excited about.

00:49:59

Dana Singleterry: So but like I said, I'll just bundle all this up. You can look through it at your own leisure. Um if you have any specific questions, you know, fire them off to Jason and me and then we can also coordinate a uh a time here in a couple weeks

where we can get Billy to come in and and do that full life cycle demo.

Ira Fox: Yeah, that sounds good. You know, one of the challenges that we have is that we always get excited about these new features.

Jason Anderson: Let's

Ira Fox: So, don't get us wrong. You know, it's kind of like when when when Solaris introduced ZFS,

Dana Singleterry: Yeah.

Ira Fox: we were so excited. Then we realized that we still have a whole bunch of Solaris 7, 8,

Jason Anderson: go.

Ira Fox: and N servers at the time. So just like this,

Dana Singleterry: Right.

Ira Fox: you know, for real 10 that's awesome, but you know, we still have for real seven in our firewalled off in our legacy network and

Dana Singleterry: Yeah.

00:50:45

Dana Singleterry: Understood.

Ira Fox: tons of real eight and tons of rail 9 floating

Dana Singleterry: Yeah. No,

Ira Fox: around.

Dana Singleterry: completely understood. Um, you know, things move at the speed of light to some degree, right? And then other things don't, but that's the main reason that we have ELS for RE7 to, you know, keep you supported, keep the uh the patches flowing and things like that. I mean it is expensive and and it's expensive for a reason and that's because we have a specialized engineering team that continues to maintain those uh end of life versions like we have a long life offering for satellite 6 which is you know just stupid expensive but some customers need that because they have legacy apps that have not been migrated to the newer versions of Linux right and so that's just kind of the way way of the world um so yeah no pressure on any of this stuff, but I'm glad to hear that you're you're exploring rail 10 at this point. And then also note that a lot of the stuff that landed in rail 10 is also backported to the latest version um of rail 9. Um so you get to take advantage of a lot of that functionality there as well such as image mode um such as um oh what do they call it?

00:52:00

Dana Singleterry: Rail light speed I think is the uh the AI version.

Jason Anderson: Yeah, real AI. Well,

Dana Singleterry: Thank you.

Jason Anderson: uh that would be tough for them because that does reach out to the internet, but they have recently made a onprim solution for that. So,

Dana Singleterry: Correct.

Jason Anderson: if that's something you're interested in um but I also wanted to mention something uh you guys at the beginning of the call said you were using image or starting to use um image builder. Uh one of the aspects I wanted to point out is in for obviously you can build real 8 9 10 and for whatever environment you want but you can also set up keys and have your systems autoregister with insights at build time.

Manikandan R: Yeah.

Jason Anderson: So it would not be a huge jump for you to get that automation in place.

Dana Singleterry: Yep, good point, Jason. Well, I'll I'll pause there for a just a second.

Um I you're running satellite 617. You got one satellite server, no capsules um whatsoever. Have you noticed any any bottlenecks in in uh your your content um facility?

00:53:17

Dana Singleterry: You know, like doing doing um whatever magic it is you do with satellite content.

Ira Fox: Um not really because right now our primary number of Linux rail servers are in Kansas City data center and that's where the satellite server is.

Dana Singleterry: Okay.

Ira Fox: We do manage the there there are some production rail VMs not many that are

Dana Singleterry: Ah.

Ira Fox: bound to the satellite server in Azure but it goes across our express route.

Dana Singleterry: Okay.

Ira Fox: So we we didn't feel it was worth the the com running a capsule 247 in

Manikandan R: Yeah.

Ira Fox: Azure

Dana Singleterry: Yeah.

Ira Fox: cost.

Dana Singleterry: Well, just know that I mean you've got 50 whenever you you purchase

Manikandan R: No.

Dana Singleterry: um rail plus the satellite add-on, you get uh 50 instances of of satellite andor capsules to configure and deploy however you want. And that 50 number was just a random number. I think a lot of it was driven by AT and their need to have, you know, a heck of a lot of satellites, a heck of a lot of capsules to get content, you know, around the world.

00:54:27

Dana Singleterry: Um, so that that's the idea there. So if you if you wanted, you know, you could throw a capsule um in Azure at no additional cost other than paying for the uh Azure infrastructure, right? So something to keep in mind there,

Ira Fox: Yep.

Dana Singleterry: you know, if you're starting to see some latency uh um issues when you when it comes to the content management piece of that

Ira Fox: Now, the only the only question that I that I have that may or may not be related to

Dana Singleterry: um

Ira Fox: this. Um, in the past and last time we renewed our subscriptions, it's it didn't seem like there are a lot of options that are reasonable for purchasing a Red Hat subscription to use in an Azure VM. You know, it would be basically you would purchase a a single instance and that would cover one VM or two VMs depending on how many virtual CPUs it had. And I don't know if Red Hat's made any changes with their partnership with with Microsoft in the last two years. I mean I understand the the images and having gold images you can present it yada

00:55:39

Dana Singleterry: Yeah.

Ira Fox: yada but from a rail subscription perspective and we don't really want to do page goes we don't have to because then we can't manage the sal you know the OS

Jason Anderson: We we do have a bring your own subscription.

Dana Singleterry: Yeah.

Jason Anderson: So you you can transfer your Red Hat subscriptions to your Azure uh VMs.

Dana Singleterry: Yeah.

Jason Anderson: The pain in the butt with Azure uh pardon my language there is by

default it sets up your repos to pull from uh their local Azure repositories. If you want to register it with Red Hat, you generally would have to point go in and chain some stuff to point to your satellite server. That's really the only difference.

Ira Fox: Well, that's solved by using our own gold images. But so you're saying there's an I haven't seen it.

Jason Anderson: Yep.

Ira Fox: So there is

Jason Anderson: Yeah, there is a bring your own subscription model for going to the cloud.

Ira Fox: a

Jason Anderson: Yes.

Dana Singleterry: You just have to uh join the cloud access program and that doesn't cost you

00:56:44

Ira Fox: Yeah, I'm already part Well,

Dana Singleterry: anything.

Ira Fox: I'm a key original card carrying member of the

Dana Singleterry: Okay. Well,

Ira Fox: Yeah.

Dana Singleterry: then you're in good shape. Um yeah,

Ira Fox: But that

Dana Singleterry: that's something that we could I I'm pretty sure Billy would be able to demonstrate how how that would work. I mean, it's it's it's pretty straightforward. Um, other than like Jason described,

Manikandan R: All

Dana Singleterry: you know,

Ira Fox: Yeah,

Dana Singleterry: pointing it back towards the satellite for for the you do.

Manikandan R: right.

Ira Fox: and we we we do that today. You know,

Dana Singleterry: Okay.

Ira Fox: we have our Azure VMs that are not OAL or whatever crazy stuff they're trying to do in

Dana Singleterry: Got

Ira Fox: our pre-sales group. Um,

Dana Singleterry: you.

Ira Fox: all the rail VMs are either using the D4T subscription or they're using that's pretty much it because we don't any production rail right now that we have in Azure is using pay as you go, but we don't have too many.

00:57:31

Dana Singleterry: Yeah.

Ira Fox: I think there's like two or something.

Dana Singleterry: Yeah. Gotcha.

Manikandan R: Exact.

Ira Fox: But,

Manikandan R: Exactly.

Ira Fox: you know,

Manikandan R: That's it.

Dana Singleterry: Well,

Manikandan R: We moved everything to

Ira Fox: but we've been having some conversations with the with the team and with our leadership about moving all

Manikandan R: Yeah.

Ira Fox: the production IT stuff that that's in Kansas City to Azure and just leaving what

Dana Singleterry: Yeah.

Ira Fox: the all the junk that PD needs in Kansas City.

Dana Singleterry: Gotcha. Gotcha.

Ira Fox: And the big challenge for me is the licensing.

Dana Singleterry: That would certainly Yeah. Um well, we

Ira Fox: you know when we go to renew our our our current subscriptions which will be in

Dana Singleterry: can

Ira Fox: you know end of the year you know the question is what is the is there a

Dana Singleterry: Yeah.

Ira Fox: different it's not available directly on the Red Hat store not that I purchase directly but likes to see what the the basic pricing is so maybe a followup email will

00:58:20

Dana Singleterry: Well, if if you're doing like what Jason said,

Ira Fox: be

Dana Singleterry: the BYOS, it's just that you're purchasing like you're per you're deploying on premise. I mean, that's that's the idea. So, you just take your your, you know, golden images or whatever that you purchase on premise and through the cloud access program,

Ira Fox: Yeah.

Dana Singleterry: you're able to uh to deploy those out to Azure.

Ira Fox: So,

Dana Singleterry: So, it's easy.

Ira Fox: so it is the same license.

Dana Singleterry: enough for you to I'm sorry. Go ahead. All

Ira Fox: You purchase a single two socket server license and that counts as two

Dana Singleterry: right.

Ira Fox: VMs which as you can imagine is pretty expensive compared to the way we do it

Dana Singleterry: Right.

Ira Fox: with for the the rail production rail we do for for VMware.

Dana Singleterry: Yeah. Well, I'm not going to speak for your account executive, but I I do know that um they they have creative ways of making it economical and um a win for you. So, that's something that Bill would be able to talk to you a little bit more about.

00:59:20

Dana Singleterry: Yeah. So,

Ira Fox: Okay.

Dana Singleterry: keep that in mind as well. Um,

Manikandan R: Okay.

Dana Singleterry: oh, I had a thought there for a second and it escaped me. If I think about it, I'll throw it in the uh the email followup uh with some of these slides and and documentation for you.

Ira Fox: I appreciate

Dana Singleterry: Um, yeah. Um,

Ira Fox: that.

Dana Singleterry: so do you want to try and and pencil in a date in a couple weeks out where we can pull Billy in to do that that life cycle? Um, have a follow-up

Ira Fox: Yeah. So like the week of the 23rd or the 27th man,

Dana Singleterry: there.

Manikandan R: Yeah.

Ira Fox: are you in that week?

Manikandan R: Yes. Next week, yes, I'll be there. I don't have any plan as

Dana Singleterry: Do you have do you have a preferred name?

Ira Fox: So the only thing I I don't know if everyone I know I forgot.

Manikandan R: of

Ira Fox: Was it Jason or Dana that was in Atlanta?

01:00:12

Dana Singleterry: I'm in Atlanta.

Ira Fox: Okay. What about Billy and anyone else?

Dana Singleterry: Thank Billy's here in Atlanta as

Ira Fox: Okay, because we're in the Eastern time zone,

Dana Singleterry: well.

Ira Fox: so the earlier Eastern time is better for ISTD folks. So like Manny is in our Indie office.

Dana Singleterry: Okay.

Ira Fox: So right now it's um to give you an idea of his dedication on a Friday.

Dana Singleterry: Gotcha.

Ira Fox: It's 9:00 p.m.

Dana Singleterry: Okay. Well, I'm sure we could do that. If Friday if Fridays are the best.

Ira Fox: Oh, no, no, no, no, no, no. I don't want to do on a Friday.

Dana Singleterry: Oh,

Manikandan R: That's

Dana Singleterry: okay.

Ira Fox: But if it if it's earlier,

Manikandan R: good.

Ira Fox: it's better. It's easier to get some of the junior people also on call as

Dana Singleterry: Okay.

Ira Fox: well.

Jason Anderson: Can we just p pencil in Wednesday?

Dana Singleterry: Well,

Ira Fox: Wednesday the 25th.

Jason Anderson: Yep.

Ira Fox: Sounds good. Can we do it earlier than 10:30?

01:00:55

Jason Anderson: And how about 9:00

Dana Singleterry: that'll work.

Jason Anderson: a.m.

Ira Fox: Sounds good to me.

Dana Singleterry: All right. Perfect.

Manikandan R: Yeah.

Jason Anderson: And Ira, I have to ask I'm obligated to ask these questions. Don't hold it against me. Um, a would you like to have, you know,

Manikandan R: Heat.

Jason Anderson: set up like a a monthly, quarterly, bi-weekly, whatever you want, just uh catch up on, you know, anything Red Hat related. Um,

Ira Fox: I I could see maybe a

Jason Anderson: and then qu Okay,

Ira Fox: quarterly

Jason Anderson: we we can I'll definitely get that set up. And then question number two, um, do you mind talking to me at another point in time about your Kubernetes and all your other stuff? I just like to learn about all your other projects and what's going on. See if there's any way, you know, Red Hat might be able to provide

Ira Fox: Oh,

Jason Anderson: help.

Ira Fox: you're making me sad. I really pushed for o I really pushed for open shift.

01:01:53

Jason Anderson: Uh, so you know where I'm going,

Ira Fox: Um yeah,

Jason Anderson: but I

Ira Fox: I I I mean I took a bunch of training with Open Shift and I really liked it.

Jason Anderson: mean

Ira Fox: Um, but you know the the devel of our of our product development team was really a Microsoft lover and so they convince everyone to use Microsoft's

Jason Anderson: Okay.

Ira Fox: Kubernetes service AKS. Um, it's nothing wrong with it, you know, don't get me wrong, it's just I'm I obviously have a a liking for rail based stuff if I can.

Dana Singleterry: Well, standardization definitely saves money,

Jason Anderson: opinions.

Dana Singleterry: right? If you

Ira Fox: Well,

Dana Singleterry: can

Ira Fox: my idea about Open Shift and I know that's kind of how it's progressed and that's why IBM acquired Red Hat in the first place is I can run Open Shift on prem. I can run Open Shift in Azure. I can run Open Shift in AWS and it's the same environment.

Jason Anderson: Yep.

Ira Fox: And I if everyone was following the same standard Kubernetes, I'd say okay that's not a big deal.

01:02:50

Ira Fox: But no one is. the

Dana Singleterry: Yeah.

Jason Anderson: It's actually grown a little bit more.

Ira Fox: anyway.

Jason Anderson: And I'm not once again not a shameless plugin, but it does also do virtualization. So it's all of your it's all of your pieces

Ira Fox: Yeah, it does virtualization till it looks at all the crappy old Windows servers we

Jason Anderson: together.

Ira Fox: have.

Jason Anderson: Yes, that I agree with. It would say no.

Ira Fox: I know it does modern

Jason Anderson: Uh yes.

Ira Fox: Windows.

Jason Anderson: Yes, it does. But yeah, if you start bringing in stuff that's 20 years old, it's going to say no.

Dana Singleterry: Well, hey, uh, Jason, since you were going to send a copy of the, uh, transcript on to Ira and Manny, you want me to just give you the,

Jason Anderson: Yep.

Ira Fox: Did

Dana Singleterry: uh, PDF so it's just one email coming from us?

Jason Anderson: Sounds good. That way we don't spam them.

Dana Singleterry: All right. Yep.

Jason Anderson: I'll I'll send a meeting out uh invite out for the 25th at 9:00 am and then a quarterly call be set up as

01:03:48

Ira Fox: you guys hear that Susso's up for sale again?

Jason Anderson: well.

Dana Singleterry: No way. I did not hear that.

Ira Fox: I just saw that in the news. I was like, again, it's funny.

Dana Singleterry: What?

Ira Fox: No, I was just googling what happened to Novail Network because I used to do Network back in the

Dana Singleterry: I used to do Noel,

Jason Anderson: Do you know?

Ira Fox: day.

Jason Anderson: So did I.

Dana Singleterry: dude.

Jason Anderson: So did I

Dana Singleterry: Yeah,

Ira Fox: And it turns out it was bought out by a company by a company who now owns Openex.

Dana Singleterry: that is too funny.

Jason Anderson: actually

Ira Fox: My company's starting open text for the legal stuff but um I thought anyways so point is no apparent I forgot the noville acquired sis the

Dana Singleterry: Yeah. Yeah. Yeah. Wow.

Ira Fox: first

Dana Singleterry: They're saying that uh the private equity firm EQT is exploring a potential sale of CISA for around \$6 billion. That is interesting, man. Oh well.

Ira Fox: maybe Netflix will buy
