Red Hat & Hershey Tech Day Discussion

Invited [Bill Venella](#) [Richard Lavin](#) [Jason Anderson](#) [Powell, Nathan](#) [Panindra Balellugari](#)

Attachments [Red Hat & Hershey Tech Day Discussion](#)

Meeting records [Transcript](#)

Summary

Nathan Powell confirmed the Red Hat licensing approval, while Bill Venella and Jason Anderson joined the discussion concerning a one-day on-site "tech day" for the engineering and architecture team. The key topics planned for the tech day include the OpenShift roadmap, the Ansible roadmap, and a RHEL focus conversation, with additional topics of interest being OpenShift Lightspeed AI use cases, DevSecOps, and Service Mesh, which Panindra Balellugari offered to cover, and Event-Driven Ansible, which Richard Lavin discussed with Nathan Powell. The team scheduled the tech day for Thursday, April 16th, and Bill Venella will draft the agenda.

Accenture is their MSP. Hershey has encountered several challenges in the process of onboarding the new Accenture team.

The only use case for OpenShift is MuleSoft.

Audience for Red Hat Tech Days: Engineering and Architecture under Jeff Ramsey

Details

- **Red Hat Licensing and Vendor Relationship:** Nathan Powell confirmed that the Red Hat licensing approval had been received and needed to be submitted to their process. They expressed mixed feelings about continuing to use SHI as their vendor, citing issues similar to those experienced with the Red Hat licensing, but also acknowledging the convenience of having many contracts consolidated with one company ([00:00:00](#)).
- **Meeting Logistics and Apologies:** Bill Venella and Jason Anderson joined the call after a delay, and Nathan Powell apologized for having to cancel the previous week's meeting on short notice due to a family medical emergency ([00:01:09](#)).

The discussion transitioned to the on-site "tech day" scheduled for Hershey, which was planned to be a one-day event to maximize attendance given the participants' schedules and attention spans ([00:01:53](#)).

- **Target Audience and Technical Depth:** The participants who will attend the tech day are all members of the engineering and architecture team, meaning the discussions can include deep technical details, though the overall technical depth will depend on the number of topics covered in the single day ([00:03:06](#)). Topics of interest include OpenShift, RHEL 10, and the broader areas of Linux, DevOps, and Kubernetes ([00:01:53](#)).
- **OpenShift and Mulesoft Focus Areas:** Key OpenShift topics desired for the tech day include the roadmap, an overview of what is next following a recent environment upgrade, and the capabilities of OpenShift beyond the team's current primary use case, which is Mulesoft ([00:04:11](#)). Nathan Powell noted that their team has only a surface-level understanding of OpenShift's capabilities ([00:05:10](#)).
- **DevOps and Service Mesh Introduction:** Panindra Balellugari introduced himself as a specialist SRE working with the team and offered to cover DevOps topics, including a service mesh software that could benefit the Mulesoft services running on OpenShift, and a software supply chain that works with existing DevOps tooling ([00:05:10](#)). Nathan Powell confirmed interest in learning more about the service mesh, as they had previously deferred its complexity due to perceived lack of benefit ([00:06:09](#)).
- **AI Use Cases and Skepticism:** When asked about interest in AI, Nathan Powell expressed skepticism, citing personal experience with AI giving confidently incorrect information ([00:07:03](#)). However, they expressed specific interest in a potential use case where AI is integrated into OpenShift, using pod logs to train itself and provide useful information about the cluster, provided limitations are realistic ([00:07:56](#)).
- **OpenShift Lightspeed and AI Strategy:** Panindra Balellugari confirmed that Red Hat has a specific AI software piece for OpenShift called OpenShift Lightspeed, which they will check for its release status and present if available ([00:07:56](#)). Bill Venella asked about Hershey's overall AI strategy, and Nathan Powell described the company as "optimistically skeptical" and interested in utilizing AI for efficiency, particularly where the technology is niche and specific to their data, such as with co-pilot ([00:08:58](#)). Currently use Co-Pilot that syncs sharepoint and emails but no use that is transformational beyond that.
- **Automation Platform and Event-Driven Ansible:** Richard Lavin joined the discussion and asked about interest in automation, particularly the Ansible Automation Platform, since they had previously done work with Nathan Powell on Ansible ([00:12:21](#)). Nathan Powell confirmed they are still using Ansible open source and are interested in seeing where things are headed with the Automation Platform, including Event-Driven Ansible and its latest components ([00:13:11](#)).

- **Ansible Automation Platform and Workflow Integration:** Richard Lavin proposed starting with an Ansible Automation Platform overview and architecture, with potential deep dives into workflow integration with ServiceNow, which Nathan Powell confirmed they use ([00:14:05](#)). The three major topics confirmed for the tech day were the OpenShift roadmap, the Ansible roadmap, and a RHEL focus conversation ([00:14:52](#)).
- **Finalizing OpenShift Topics for Tech Day:** Panindra Balellugari suggested adding DevSecOps and Service Mesh to the agenda and focusing the OpenShift conversation on Platform Plus features that would benefit Nathan Powell's team, rather than exclusively the roadmap. Jason Anderson agreed with the suggestions and mentioned the possibility of discussing OpenShift 4 versus 5 during the roadmap discussion, pending internal review of the readiness of OpenShift 5 material ([00:15:50](#)).
- **Scheduling the Tech Day:** The team decided to aim for late this month or early next month, settling on Thursday, April 16th, to give attendees enough advance notice ([00:17:00](#)). They planned for an early session to mitigate issues with afternoon traffic, and Jason Anderson committed to sending a placeholder calendar invitation ([00:18:01](#)).
- **Final Logistics and Next Steps:** Nathan Powell confirmed they would reserve a large conference room with a projector at the 19 East main office and promised to forward the attendee list for the placeholder invitation ([00:18:01](#)). Bill Venella committed to drafting an agenda based on the discussion, which Nathan Powell is invited to modify and provide suggestions for ([00:18:01](#)).

Suggested next steps

Jason Anderson will send out a placeholder for the tech day on Thursday April 16th and a draft agenda

Nathan Powell will forward the placeholder for the tech day to the right people.

Nathan Powell will send a list of emails to the Red Hat team.

Nathan Powell will reserve a big conference room for the tech day at 19 East, the main office.

Panindra Balellugari will double-check the availability of OpenShift Lightspeed to present it during the tech day.

The group will draft up an agenda for the tech day and share it with Nathan Powell for modification and suggestions.

Red Hat & Hershey Tech Day Discussion - Transcript

00:00:00

Nathan Powell: It's It's approved. I just got the approval. So, I just need to submit it now to our process. So, that's going to all happen. I don't know what's going on over there. That's

Bill Venella: Thank Thank you for

Nathan Powell: Yeah, I'm still torn.

Bill Venella: that.

Nathan Powell: I You guys aren't the only people that we go through SHI for and I've had a lot of issues very similar to the ones that we faced with the Red Hat licensing. And the my the only thing keeping me from throwing a major fit is that it is somewhat nice to have a bunch of my contracts with one company and one place to go to check everything,

Bill Venella: Yeah,

Nathan Powell: which is the sort of the VA and the VAR name.

Bill Venella: if you can get a hold

Nathan Powell: But yeah,

Bill Venella: of

Nathan Powell: it's it's at this point though it's barely a value ad.

Bill Venella: Right.

Nathan Powell: So

Bill Venella: Right.

Nathan Powell: anyway,

Bill Venella: Well, we could talk about that over a beer.

00:01:09

Nathan Powell: yeah, exactly.

Bill Venella: Anyway, well, Jason is on. Uh, sorry we we were delayed on another call,

Nathan Powell: Great.

Bill Venella: but

Nathan Powell: No, I I apologize for last week.

Bill Venella: Jason.

Nathan Powell: I did not intend to to cancel at such late notice. I just um my girlfriend actually hurt her back and we were running around and

Bill Venella: Oh no.

Nathan Powell: need one doctor's appointment turned into three doctor's appointments in the same day and I was like I'm just getting this taken care of because we got to get this solved. So again,

Bill Venella: Yeah.

Nathan Powell: I apologize, but it was a somewhat legit uh reason to step

Bill Venella: No, no worries. That that's more important.

Nathan Powell: out. Not to give too much information.

Bill Venella: Right.

Nathan Powell: I'm sure my girlfriend would be like mad at me for telling you that.

Bill Venella: There you go.

Nathan Powell: So,

Bill Venella: Well,

Nathan Powell: all

Jason Anderson: All right.

Bill Venella: Jason,

Jason Anderson: All right.

Bill Venella: it's your call.

Jason Anderson: Well, uh, let me turn on my camera so you can see my ugly mug.

00:01:53

Nathan Powell: right.

Jason Anderson: Um this call is Nathan just to recap um you know an on-site that we had talked about to uh do kind of a tech day for uh Hershey. So I just kind of wanted to reconvene with you, you know,

Nathan Powell: Yeah.

Jason Anderson: and see what your game plan is, you know, do we want to do a bunch of short sessions?

Nathan Powell: Sure.

Jason Anderson: Do we want to do it over a couple days? Do we want to do a couple tracks? I I we really didn't kind of I just kind of threw it out there that we would come um without any logistics at

Nathan Powell: Uh yeah, no worries.

Jason Anderson: all.

Nathan Powell: And I talked to a couple of the other folks on my team. There's there's some interest in other people joining us. So I think I think it to get um the maximum number of people and and given their schedules and attention spans we probably want to just try to do a day and you know cover you know the things we think maybe are most important you know things within open shift I definitely want to talk about real 10. I've been trying to hammer the guys about getting a a packer image for real 10 going.

00:03:06

Nathan Powell: we're we're not really deploying it yet, which I kind of feel like we're a little behind. So, I'd like to just get more information about that. I know we talked about that before. And then, you know, we're certainly open to other other topics, you know, within the wheelhouse of, you know, uh Linux, DevOps, Kubernetes, you know, the whole the whole space. So, we're we're open to that. But, yeah, I think one day is probably all I could get people to commit to. And you know, you guys can come on site and get a conference room and hang

Jason Anderson: Okay. Um,

Nathan Powell: out.

Jason Anderson: can you give me a idea of how technical you want this to be? Like is this overview or do you want to go deep into the weeds?

Nathan Powell: Well, I guess it depends on the number of topics. I mean, the the the folks that'll be there will all be members of the engineering and architecture team. So, it's you don't have to hold back on technical details, but at the same time, if we want to cover a lot of ground, I don't know how deep you'll be able to get on certain

00:04:11

Jason Anderson: Fair enough. All right. So, I've got real um Kubernetes.

Nathan Powell: topics.

Jason Anderson: Uh any particular aspect of Open Shift you would like to talk about or um just of what's new with the road map or you know what

Nathan Powell: Yeah, that that might be good. Roadmap stuff would be welcome.

Jason Anderson: would

Nathan Powell: Uh, you know, find out which direction we're headed. um what what you

guys have planned. Um the like I said, the hot topics right now for us are the I don't know if you were here for that, but we're we're almost finished with our most recent upgrade of all the environments.

Jason Anderson: Thank

Nathan Powell: Um been somewhat of an arduous process, but we're there. Um I guess we'd like to know then, yeah, what's next? You know,

Jason Anderson: you.

Nathan Powell: I know we've talked a little bit before, but the our main use case is um for Mulesoft at the moment. So I think there's a lot of stuff that Open Shift can do that we don't even look at or have any real understanding of because it's just not not something we need.

00:05:10

Nathan Powell: So I I think you could really cover just about any topic there. We have a pretty surface level understanding of the capabilities of Open

Panindra Balellugari: Yeah.

Nathan Powell: Shift.

Panindra Balellugari: Uh, Nathan,

Jason Anderson: Okay.

Panindra Balellugari: uh, real quick, my name is my name is Panendra. I'm one of the specialist essays that, uh, that is allocated to to Bill and you know, I work for you guys as well. Uh, you talked about DevOps. So there are a couple of cool things that I can talk about DevOps as well and specifically when it comes to you know since you guys are running Mulesoft my understanding is you're also running the services that are created through Muleoft on open shift as well. So there is a there is a mesh software that could be very beneficial as well. So I can talk about DevOps uh we we've created a software supply chain um that could go hand inhand with your existing DevOps tooling as well. Um and I can also talk about service mesh that could be very beneficial for uh for the mulesoft

00:06:09

Nathan Powell: Yeah, I think we'd like to know more about service mesh.

Panindra Balellugari: teams

Nathan Powell: think uh you so far we've kind of put off that level of complexity because

we didn't really see as much benefit,

Panindra Balellugari: value.

Nathan Powell: but it's it's it's also not something we're super familiar with. So that would be fine.

Panindra Balellugari: Yeah. Yeah. I I'll talk through it and then we can we can we can think about next steps of you know hands-on workshops and whatnot.

Nathan Powell: Sure.

Panindra Balellugari: Sometimes developers get really excited when they see in action because I I have a development background. Uh I personally love the mesh for the functionality that it provides. Um so so those are the things that I can talk about and also there's a bunch of development tooling that comes with uh open shift as well. Uh we can talk through that as well. If you have other developers uh coming in and if they are using Java, Spring Boot or any other development stack uh you

Nathan Powell: Unfortunately, these are going to mostly be systems people.

00:07:03

Panindra Balellugari: know okay no that's fine if if any of those guys step in as

Nathan Powell: So, sure.

Panindra Balellugari: well you know I'll be more than happy to talk to them too.

Nathan Powell: Great. Yep.

Panindra Balellugari: Thank

Nathan Powell: Thank you.

Panindra Balellugari: Sorry, Jason. I cut you off earlier. I apologize.

Jason Anderson: It's all good. Um, I was just Nathan, do you have any interest in AI?

Nathan Powell: Do you want do you want my my working answer or my real

Jason Anderson: I want I want I want your honest

Nathan Powell: answer? No,

Jason Anderson: answer.

Nathan Powell: I don't I don't have very little interest in it. I use it all the time and it lies to me constantly and I can't get I was actually talking to Claude today about SAML in open shift which right in the documentation says it's not possible and Claude was assuring me that it was. So anyway,

Jason Anderson: But you know what? It assured you really

Nathan Powell: uh yes it was extremely confidently wrong.

00:07:56

Jason Anderson: confidently.

Nathan Powell: Um I I mean you know so certain I'm not like a complete anti-

Panindra Balellugari: Okay.

Nathan Powell: AI lite but uh I would be interested to know like you know if you if there's a plan to bake it into open shift and it can use like all the pod logs as a corpus to train itself on and could like tell me things about my cluster. I think that's probably a use case I'd be interested in.

Panindra Balellugari: Nathan,

Nathan Powell: I just as long as we're realistic about the limitations.

Jason Anderson: Yes.

Panindra Balellugari: you you hit the nail on the head when

Nathan Powell: Go ahead.

Panindra Balellugari: it comes to AI for Open Shift. There's a specific piece of software which we call it as open shift light speed uh that we were working towards. Uh let me double check that and if I believe it is it is it is doing there are a couple of features that it has got that I wanted before I put in front of my customers. I I I was told that it was in tech preview and or in in in in released recently.

00:08:58

Panindra Balellugari: So let me double check that and if it's available I'd be more than happy to you know uh present

Nathan Powell: Sure.

Panindra Balellugari: that during our uh tech day

Nathan Powell: Yeah. I think I think you'd find most of the people that are going to be here are sort of aligned with me where it's like,

Panindra Balellugari: tag.

Nathan Powell: you know, we're not against it, but I I have yet to see a product that made me believe the hype I'm hearing. But yeah, I mean that's that's sort of like baked in specialized thing.

Jason Anderson: Darn it.

Nathan Powell: I think that's potentially a sweet spot for it. So yeah, let's hear about

Panindra Balellugari: Cool.

Nathan Powell: it.

Bill Venella: Yeah. So question around that. What's uh what's Hershey's stance around an AI strategy?

Nathan Powell: Yeah, I don't know that we've articulated one that I could repeat. I I So, you know, I think we're like most companies our size, we're we're interested in the possibilities. We're, you know, optimistically skeptical. I don't know how to but if if we can find ways to utilize it that that actually makes things more efficient or go faster, I think we're all on board with that.

00:10:08

Nathan Powell: And you know, we're we have co-pilot. Um, there's some things there that are very useful like it can it's reading our SharePoint and our email and you know so you can ask it questions about hey where's that spreadsheet Jeff was talking about and it's like oh here I think this is what you're talking about. I mean that kind of stuff is super useful but it's it's very niche right it's like specific to our our data. Um, so yeah, I think the places where it makes sense,

Jason Anderson: Can I Can

Nathan Powell: we're in favor of it and quickly to move away from it when it's,

Bill Venella: Sure.

Nathan Powell: you know, a time suck.

Jason Anderson: I

Nathan Powell: Go

Bill Venella: Yeah. I mean I think the uh the key for us is well so one

Nathan Powell: ahead.

Bill Venella: I think uh there are a lot of companies that are testing out use cases but uh very few that have a an operational strategy around AI yet that have been implemented in production and I think that's where we are.

00:11:06

Nathan Powell: Right.

Bill Venella: we're more to the right. Uh once you have a strategy and you want to uh build out a

Nathan Powell: f***.

Bill Venella: platform around that and ensure that your data and your models are secure, that's that's where we play.

Jason Anderson: Um, I I would uh also I find it funny,

Nathan Powell: Okay.

Jason Anderson: Nathan. Uh, I kind of thought the same thing. Um, and then I watched uh this video that I'm about to put into the chat here and I would highly encourage you to watch uh after uh our our conversation.

Nathan Powell: Not right now.

Jason Anderson: Yeah. But um the concept that you know I've been thinking about is like setting up

Nathan Powell: Sure.

Jason Anderson: MCP servers to you know like paris logs and do AI on that you know I mean and think about how detailed you could

Nathan Powell: Yep.

Jason Anderson: get down to that level if I see this kind of kernel or you know this kind of traffic or whatever. Um that I thought that that would be really cool.

00:12:21

Jason Anderson: Um, but that's just the inner nerd in me coming out. Just because you can't do it doesn't mean you always need to.

Nathan Powell: Yeah.

Jason Anderson: Uh, but if that's something you guys are interested in, um, it is kind of a cool concept.

Richard Lavin: Hey,

Nathan Powell: Sure.

Jason Anderson: And, uh,

Richard Lavin: Jason.

Jason Anderson: Yep. Go ahead,

Richard Lavin: Yeah, this is Rich Lavin.

Jason Anderson: Rich.

Richard Lavin: I sorry I joined late. Did you guys already talk about automation or I don't want to have to

Jason Anderson: We h we have not we have not talked about automation to this point.

Richard Lavin: re Yeah.

Jason Anderson: Sir, go right

Richard Lavin: So, hi Nathan. How are you? I'm Rich Lavin.

Jason Anderson: ahead.

Richard Lavin: We spoke about a couple years ago did some work with you and Jeff around uh Ansible

Nathan Powell: Okay,

Richard Lavin: Automation Platform, NetJet Summit,

Nathan Powell: sure.

Richard Lavin: etc., etc. So, I just wanted to, you know, just hear if that was still of some interest to you around automation.

00:13:11

Nathan Powell: Sure,

Richard Lavin: Um, and just kind

Nathan Powell: we're definitely interested in automation. Uh, you know,

Richard Lavin: of

Nathan Powell: we've made a couple changes in the environment. Uh, we are using Anible open source still. Um, I know, you know, I'm certainly interested in Anible. I ran into some licensing issues with the the last effort we had around automation platform, but I you know, absolutely. I mean, I think you guys should take the opportunity to show us where things are going and, you know,

Richard Lavin: Okay,

Nathan Powell: let us know what you're up

Richard Lavin: great. Yeah, I was thinking about like, you know, we're on 2.6 right now.

Nathan Powell: to.

Richard Lavin: We can show you the latest and greatest components along with event driven anible and all these other the different things that customers are taking advantage of.

Nathan Powell: Yeah,

Richard Lavin: So,

Nathan Powell: the last time I went to a Red Hat conference, I think uh that was like the day they were announcing event driven anible. And I'm sure it's more fleshed out now than it was then.

00:14:05

Jason Anderson: Oh yeah.

Richard Lavin: Absolutely.

Nathan Powell: They also did a demonstration of Watson as a plugin to Visual Studio Code.

Jason Anderson: Oh yeah.

Nathan Powell: So, I'm sure that's probably more fleshed out now, too. I think it failed on

stage, but the downsides of a live demo.

Richard Lavin: Right.

Bill Venella: Yeah, it's much more involved.

Nathan Powell: Yeah.

Bill Venella: It actually works.

Nathan Powell: Okay. Well, good. I mean,

Bill Venella: Now,

Nathan Powell: it it seemed like it was going to work. It's just a live demo that's is unpredictable.

Bill Venella: good news is,

Richard Lavin: So we can start

Nathan Powell: So,

Bill Venella: you know, you don't have to use uh you don't have to use Watson X.

Richard Lavin: off.

Bill Venella: You can you can bring your own model.

Richard Lavin: Yep. So we could start off kind of with a you know ensible automation platform overview and architecture and then

Nathan Powell: okay.

Richard Lavin: from there we can figure out you know where we want to do any deep dives whether you have workflows into you know service now or whatever CMDB you have and go from there.

00:14:52

Nathan Powell: We are a service now shop. Yep.

Richard Lavin: Yep. So we can definitely talk about you know the AAP workflow automation with Service Now etc.

Jason Anderson: All right. So it sounds to me I heard three major topics.

Nathan Powell: Great.

Jason Anderson: Roadmap for open shift road map for anible and relin focus conversation. Does that sound about

Nathan Powell: Yep.

Jason Anderson: right?

Nathan Powell: Sounds good to me. Like I said, if you guys if you guys have some other,

Panindra Balellugari: Yeah.

Nathan Powell: you know, minor topics you want to bring up, that's fine, too. Time dependent. You know, we're it's going to be an easygoing bunch.

Panindra Balellugari: Yeah.

Nathan Powell: I mean, I most of you probably know most of the folks that have been there in some capacity. Um, it's the engineering and architecture team. So, it's the people that report either directly to Jeff or or just one person under Jeff.

Panindra Balellugari: Cool.

Nathan Powell: So, it's uh they're all pretty technical folks, so we can we can get down into details.

00:15:50

Panindra Balellugari: Jason, can we also add the dev sec ops uh uh that you know Nathan was initially pointing towards and also service mesh as well and instead of open

Jason Anderson: Yes.

Panindra Balellugari: shift road map let's let's yeah let's let's let's keep it as open shift road map I want to give latest and greatest on what all open shift has got

Jason Anderson: Well,

Panindra Balellugari: including yep

Jason Anderson: I was actually just thinking about that, Preninja. um if we should talk about Open Shift 4 or Open Shift 5. Um being that it is a roadmap conversation

Panindra Balellugari: Yeah. Uh I will see what because we don't have ton of five stuff there. Even if we do, I don't know if we uh we have to put in

Jason Anderson: What?

Panindra Balellugari: front of uh Nathan right now. So let me let me I need to dig a little bit on that before uh calling it out.

Jason Anderson: Okay.

Panindra Balellugari: So definitely um instead of instead of just giving them a road map, I want to use this as a chance to talk about platform plus and some of the features we have in open shift that could be very beneficial for Nathan's team.

00:17:00

Jason Anderson: Sounds like a plan.

Panindra Balellugari: Cool. Thank you, sir.

Jason Anderson: All right. Uh now I guess the next topic that we need to figure out is uh when do you want to do this,

Nathan Powell: Yeah,

Jason Anderson: Nathan?

Nathan Powell: that's always a that's always the hard part. It's like, oh, you want to actually execute on this. Um, I think we should probably shoot for like late this month or early next month. Um, I want to give folks time so that, you know, when I say, "Hey, it's going to be on this Thursday or whatever," they can kind of plan it out and they don't already have things booked. Um,

Jason Anderson: Yeah,

Nathan Powell: so go ahead.

Jason Anderson: the first April would probably be best, I think.

Nathan Powell: Early April, you're you're saying? Okay. Yeah. I think like so these guys never like to hear this but Fridays are always the

Jason Anderson: Yeah.

Nathan Powell: best because like they're always freer but then they complain about me scheduling things on Fridays and making them drive to the office.

00:18:01

Nathan Powell: So let's maybe shoot for a Thursday. See they probably still won't be happy but we can try that.

Jason Anderson: All

Nathan Powell: Oh, uh, like the 9th,

Jason Anderson: right.

Nathan Powell: the 16th, that gives them plenty of

Bill Venella: Yeah.

Nathan Powell: time.

Jason Anderson: All right.

Bill Venella: And we can do uh we can do like an early session that way uh you know everybody's not stuck with trying to get home in

Nathan Powell: Sure.

Bill Venella: traffic.

Nathan Powell: So, we want to do the 16th.

Bill Venella: April 16th.

Nathan Powell: Yes. It's a Thursday.

Bill Venella: Yeah. Open right now.

Jason Anderson: It's Mark. I'll I'll send out a placeholder.

Nathan Powell: Okay. Okay. Yeah. I'm not going to bother to reserve time in people's calendars. I think that's far enough out that if you send that a placeholder, I can forward it to the right

Bill Venella: Yeah.

Nathan Powell: people.

Bill Venella: And then can you uh I guess Oh,

Nathan Powell: I can send you a list of emails that I sent it to.

Bill Venella: yeah. And then I was going to say just section off like a place for us to be

Nathan Powell: Oh, yeah. Yeah. I'll get us a room. Don't worry about that.

Bill Venella: housed the

Nathan Powell: Yep. Yeah. We'll we'll go to um 19 East,

Bill Venella: day.

Nathan Powell: the main office, and we'll get a big conference room there, and they'll be projector,

Bill Venella: Awesome.

Nathan Powell: you know.

Bill Venella: Sweet. We can stop by the Hershey store

Nathan Powell: That's right. Yeah,

Jason Anderson: Um.

Nathan Powell: it'll be a Thursday, so it'll be open.

Bill Venella: again.

Nathan Powell: That's one downside to Fridays as well as the store is not open.

Bill Venella: Awesome.

Nathan Powell: So,

Jason Anderson: All right.

Bill Venella: All right. So, uh, we'll we'll take all of this.

Jason Anderson: Um

Bill Venella: We'll draft up a an agenda, share that with you. Feel free to modify it and, you know, offer some suggestions if we got anything wrong.
