Meeting records [Transcript](#)

Summary

Jeff Ekstrom from Red Hat introduced RE 10's key features, including Real Lightspeed, image mode, Insights Deployment Planner, post-quantum cryptography, and AI enhancements, explaining their value and inviting testing. Participants like Ira Fox and Rahul from Blue Yonder, along with Justin Deffenbaugh and Manikandan R, discussed licensing, applicability to VMs, upgrade paths from older RE versions, and AI integration, while Brad Childress offered follow-up sessions for more detailed discussions. The meeting served to inform Blue Yonder about significant changes in RE 10 and initiate further exploration into these new capabilities.

Details

- **Meeting Introduction and Goals** Jeff Ekstrom initiated the meeting by stating the goal of an interactive discussion about new features in Red Hat Enterprise Linux (RE) 10 and their potential value, as well as to outline follow-up sessions for questions and demos. Jeff Ekstrom's desired outcome was for the attendees to gain awareness of the Red Hat roadmap and consider testing RE 10 in a lab environment ([00:00:00](#)). Jeff Ekstrom highlighted that RE 10 introduces fundamental changes in how Linux is built, deployed, and managed, aiming to improve user productivity ([00:00:54](#)).
- **RE 10 Key Changes Overview** Jeff Ekstrom outlined five key changes in RE 10: addressing the Linux skills gap with Real Lightspeed (command line assistant), image mode for containing drift, Insights Planner for better build-time decisions, new quantum-resistant encryption standards, and enhancements for the AI experience. The discussion would cover each of these areas to provide an understanding of the new capabilities in RE 10 ([00:01:51](#)).
- **Real Lightspeed (Command Line Assistant)** Jeff Ekstrom introduced Real Lightspeed as a generative AI engine (backed by Watson X) that can assist users

by answering natural language questions related to Linux configuration, troubleshooting, and package recommendations ([00:01:51](#)). Ira Fox inquired about the requirements for using Real Lightspeed, specifically regarding licensing and internet connectivity ([00:03:55](#)). Jeff Ekstrom clarified that it should be available with any valid RE entitlement but currently requires internet access due to its reliance on Watson X, a point of feedback from several customers that will likely be addressed in future iterations ([00:05:05](#)). Jeff Ekstrom suggested using it in sandbox environments with internet access and offered to share links to online labs for experimentation ([00:06:05](#)). Ira Fox acknowledged the technology as "really cool" and was curious about the roadmap and integration with Red Hat Insights and Ansible Automation ([00:07:03](#)). Jeff Ekstrom explained the general direction towards integration between management tools and platforms, indicating that Lightspeed and Insights Deployment Planner will work together ([00:08:05](#)). Ira Fox raised a valuable use case regarding developers who are not Linux-savvy being able to use Lightspeed for common tasks like using Podman on RE 10 ([00:09:33](#)). Jeff Ekstrom confirmed that Lightspeed would support such queries, potentially saving time for experienced systems administrators ([00:10:51](#)).

- **Image Mode for Operating System Management** Jeff Ekstrom explained that image mode in RE 10 allows managing the underlying operating system image similarly to containerized application images, providing benefits like improved security, easier rollbacks, and simplified updates ([00:11:42](#)). Ira Fox stated that Blue Yonder currently uses Packer pipelines for building server images for VMware and Rancher for their Kubernetes clusters, using Harbor IO and GitHub Actions for container image management. Ira Fox sought clarification on whether deploying a RE 10 VM would now involve deploying a container ([00:14:40](#)). Jeff Ekstrom clarified that while traditional deployment methods remain, image mode offers the option to leverage container tools and automation for OS image management, making it production-ready ([00:16:03](#)). Ira Fox and Manikandan R expressed initial confusion, associating image mode primarily with containers and OpenShift, and were curious about its applicability to traditional VMs ([00:17:07](#)). Justin Deffenbaugh clarified that image mode is a set of tools to help manage base images more easily, similar to container management styles but not necessarily tied to containers themselves. Ira Fox mentioned their preference for Packer due to its cross-platform capabilities ([00:19:13](#)). Ira Fox also raised the issue of difficult RE licensing in Azure. Jeff Ekstrom offered a follow-up session focused on image mode to address these questions and provide more specific details ([00:17:07](#)) ([00:20:20](#)).
- **Insights Deployment Planner for Proactive Decision Making** Jeff Ekstrom introduced Insights Deployment Planner as a tool that works with Real Lightspeed to provide package recommendations and product lifecycle details, helping users avoid technical debt at build time. The planner can identify potential pitfalls like deprecated packages or major upcoming changes ([00:22:20](#)). Jeff Ekstrom shared an anecdote about a banking customer

struggling with outdated RE versions, highlighting the need for proactive planning, which Insights Deployment Planner aims to address ([00:23:18](#)). Ira Fox found the package recommendation aspect intriguing, especially given past issues with outdated RE versions within their organization. Ira Fox raised concerns about the compatibility of older RE versions like 7 with Insights ([00:25:27](#)). Jeff Ekstrom mentioned the existence of an Insights advisor in Satellite with an on-prem plugin, offering offline capabilities, though specific feature details would require a more focused discussion with specialists ([00:26:28](#)). The discussion revealed that Blue Yonder has a significant number of RE 7 systems, some without extended support ([00:29:17](#)). Rahul from the cloud side of Blue Yonder (representing a larger infrastructure) explained their plan to upgrade these systems to a supported version within two years and migrate to the public cloud ([00:30:28](#)). Ira Fox inquired about the ability of Insights to analyze existing VMs for outdated packages, which prompted a discussion about Blue Yonder's use of BigFix for patching ([00:31:48](#)). Rahul clarified that the upgrade path for RE 7 is already decided, with a plan for fresh builds on newer versions ([00:33:50](#)). Jeff Ekstrom offered to provide more information on Insights Deployment Planner offline and encouraged Ira Fox to test it in a lab environment ([00:35:20](#)).

- **Post-Quantum Cryptographic Algorithms** Jeff Ekstrom discussed the inclusion of post-quantum resistant algorithms in RE 10 to address the future threat of quantum computing potentially decrypting current encryption standards ([00:36:06](#)). Ira Fox acknowledged the importance for future security compliance but stated it is not an immediate concern for Blue Yonder today, though their security team would be interested in learning more ([00:37:11](#)). Ira Fox humorously noted their more pressing security challenges relate to human factors ([00:38:18](#)). Ira Fox also inquired about Red Hat's testing capabilities for quantum hacking. Jeff Ekstrom indicated that testing would be necessary to validate the quantum resistance of their algorithms but could not provide specific details on their resources ([00:38:18](#)). Jeff Ekstrom offered to follow up with more information on how Red Hat approaches the design and testing of these algorithms ([00:39:10](#)).
- **RE 10 as a Trusted AI Foundation** Jeff Ekstrom highlighted Red Hat's history of creating enterprise-grade products from upstream projects and establishing partner ecosystems, applying this to AI with RE 10 ([00:39:10](#)). The goal is to simplify onboarding new AI projects by validating AI hardware and software through a partner program and providing trusted community content ([00:41:00](#)). Jeff Ekstrom mentioned features like simplified management with Podman, streamlined image deployment with image mode, vector database extensions for improved AI accuracy, confidential computing support for data in use encryption, and the ability to import custom language models ([00:42:23](#)). Ira Fox stated that AI initiatives are primarily handled by a dedicated AI group within Blue Yonder, outside the scope of their IT infrastructure team ([00:43:19](#)). Ira Fox mentioned their interest in generative AI tools for managing Kubernetes and noted that Blue

Yonder's AI currently runs primarily in Azure, a significant partner of theirs ([00:44:21](#)). Ira Fox also raised the point that while tools can be provided, the underlying AI engine and hosting are significant considerations ([00:45:27](#)). Jeff Ekstrom clarified that RE 10 aims to be a conduit for implementing both internal and external language models securely within an organization, with a certification process for external models ([00:46:36](#)).

- **Other Major Changes in RE 10** Ira Fox inquired about other significant changes in RE 10, such as kernel versions, file systems, and memory management improvements. Jeff Ekstrom mentioned that he is compiling a document addressing upgrade considerations from RE 9 to RE 10, similar to questions about previous upgrades, and will share it offline once completed ([00:47:36](#)). Jeff Ekstrom reassured that the upgrade to RE 10 is not expected to be a major disruption, unlike the transition to systemd, but there are still important aspects to consider ([00:48:34](#)).
- **Session Wrap-up and Follow-up Actions** Jeff Ekstrom thanked everyone for their participation ([00:48:34](#)). He inquired if there were any final questions for the Red Hat team. Brad Childress offered to send over links with more information and expressed willingness for follow-up sessions on specific topics like AI or system management integration with Ansible and Insights ([00:48:34](#)). Ira Fox and Rahul thanked the Red Hat team .

Suggested next steps

Jeff Ekstrom will check back with the group in a week regarding image mode and send a document detailing RHEL 10 changes and upgrade considerations.

Jeff Ekstrom will provide more information offline about insights deployment planner and RE7.

Jeff Ekstrom will try to get information on how Red Hat designs and tests quantum-resistant algorithms.

The group will inform Red Hat about any needed follow-ups on AI, Ansible integration, or insights with satellite for system management.

Blue Yonder - RHEL10 Review - Transcript

00:00:00

Jeff Ekstrom: But what I like to do with customers is I like to make this an interactive and conversational approach to this. So I don't want to just throw content at you uh you know while you sit and have some coffee. I'd rather uh rather us have a discussion. What I'd like to do is talk about a new feature in real 10 uh and then talk about how you accomplish a similar that similar outcome today and where you see value in some of the things we put in real 10. Uh in addition, you know, there's usually a good bit of follow-ups, uh some questions, some additional demos or things like that that we might want to see as a as a separate session. So hopefully we can flesh that out as well. And ultimately, you know, what I want as a successful outcome for this is for you all to have, you know, a good awareness of the overall roadmap at Red Hat and uh at least like uh Brad was saying, at least a plan to put it in a lab, kind of kick the tires.

00:00:54

Jeff Ekstrom: Um, I wouldn't realistically expect most customers to take a, you know, a brand new release like this into production right away, but it is good idea to bring it into a lab and kind of see what you like, what you don't, and, you know, use that as an opportunity going forward to ask us some questions. So, without further ado, um, Re. So, there's five key changes that have been made to Re 10 that really, um, that really can help you as, uh, as users to be more productive. And I, you know, I really tell all of my uh customers that this is uh there's some fundamental changes in the way that Linux is built, deployed, and managed over its life cycle in real 10 that uh that really can make you more efficient that can really fundamentally change the way that you do things. And so what we'll walk through today is first um you know addressing what we call the Linux skills gap, but using that with uh real light speed or as it's also called the command line assistant.

00:01:51

Jeff Ekstrom: Uh then we'll talk about how image mode can help us with containing drift and and manage our operating system images more like we would a container image for those of you that are familiar with developing containerized applications. Uh then we'll get into insights planner and how that helps you make better decisions at build time. Uh you know how to avoid technical debt before you step in the technical debt right. Uh then we'll talk about how um we've got new encryption standards within RE 10 that are uh that are resistant to quantum computer hacking of existing computer standards. And then finally last we'll talk about what everybody has to talk about right and that's AI and how real 10 makes the AI experience better how it on board helps you to onboard new tools and AI related technologies more quickly and to become more productive as you're working with AI. So first thing that we'll show you today is addressing the Linux skills gap. So real light speeded uh is basically it's Watson X on the back end. And so it has uh it's a generative AI engine or or natural language processing engine that you can speak to in natural language.

00:03:02

Jeff Ekstrom: And what it does is you can just go to it and say, "Hey, how do I configure a clustered file system?" Or, "How do I troubleshoot um how do I, you know, troubleshoot performance issues with this database?" Or I want to install Tomcat, what other packages should I include? Questions like that. Light speeded can come back. It can give you the uh commands you need to know. It can tell you the file system uh structure, the processes you would need to know. um you know any sort of things like that, things that a that a very seasoned Linux admin would know. Uh but somebody that maybe is a little bit newer to the platform, you know, and I know a lot of teams tend to be a mix of very, you know, very seasoned people and maybe some other people that are, you know, not quite as experienced, but it's something that for those that are a little bit lower on the experience uh scale that it can help them, you know, as an accelerator.

00:03:55

Jeff Ekstrom: And for somebody that's extremely experienced, it's a force multiplier because you already really know what it is you need to know. And sometimes this can this can kind of streamline the process of delivering that knowledge you have. So the

first question I'd have for the Blue Yonder team, uh whether we're talking, you know, either Blue Yonder or HCL, it doesn't matter, but how does your how does your your overall kind of experience profile with your systems engineers and admins and that sort of thing? Like how does your experience profile break down? Is everybody fairly senior or is there kind of a mix of of you know entry level, mid-level, senior? Like what's the mix look like in terms of in terms of experience and talent?

Ira Fox: Well, I can't speak on the HCL side. For the IT side, we're pretty experienced with rail, but honestly, um, right now we're just using chatgpt when we need to know a command line parameter or more importantly, we use the man page. Um but you know one of the things that I would be kind of curious to know is that what are the requirements you know to use Linux light speeded on a real 10. Can you use it if you only have a developer license?

00:05:05

Ira Fox: What if you're in a like where we are where everything is blocked from the internet? How does it work then? That kind of stuff.

Jeff Ekstrom: Yeah. And and that's a question I get a lot. Um you know with any any uh valid entitlement to re you should be able to use light speeded. I don't know you know right now this initial version it uses Watson X in the back end so it does need internet connectivity. Uh but I you're probably the fifth sixth customer now to to tell me that. So um you know that's something that I think in subsequent uh iterations that uh that they're going to be working on. I know that within this release of uh of re we're coming up with the offline insights um advisor or I got the name all wrong but you get the idea. It's an

Ira Fox: All

Jeff Ekstrom: offline

Ira Fox: right.

Jeff Ekstrom: offline version of insights for customers. Um, and so to that end, I would expect that as Lightseed becomes uh a little bit more mature, this is, you know, brand new, but as Lightseed becomes a little bit more mature, they're going to address that as well because that's a significant portion of our customer base.

00:06:05

Jeff Ekstrom: But this initial version uh does run uh with Watson X. So what I would

encourage is if you have a sandbox system, if you have something that's not attached to like the the corporate systems with those restrictions, I would suggest you kind of kick the tires there so that you can have that connectivity. And maybe if there's something you really need to know, you you you enter it on system A and then you run it on system B. But there's probably a few ways that you can do it. Um, and I'm looking for I had this link. I've got about 700 links open. Uh, so I can't find it right now, but I had a collection of online labs that I wanted to share with you all and I'm

Ira Fox: Okay.

Jeff Ekstrom: send you the link offline, but inside those labs, you should be able to do things like play around with light speed, play around with image mode, uh, and a number of other things. And, and Justin, um, uh, if you've got that link to all of the instruct labs for re uh, if you wouldn't mind sending that.

00:07:03

Jeff Ekstrom: I do not have it open and I I don't want to

Justin Deffenbaugh: Yeah. Yeah. Let me

Jeff Ekstrom: wait.

Justin Deffenbaugh: let me pull it up and I'll put it in chat.

Jeff Ekstrom: Okay, thank you. Um, but in in in the meantime though, internet connectivity aside, does this in a general sense, does this feature does this hold value for you all as a systems engineering team that that you know I can speak to it in natural language? I can figure out uh I can get advice for installing applications and this can become uh an assistant not just in troubleshooting problems but in actual uh deployment of new technologies and and planning out my builds and that sort of thing. Like where does this rate for you?

Ira Fox: I would say it's really cool tech. Um, I think everyone probably on this call at some point has either used our own on our own inside horizon GBT solution or our or I use chat GBT more because I research you know a lot of different technology.

00:08:05

Ira Fox: Um, I'd be kind of curious to see what the road map is and where Red Hat's taking light speed versus what the the intelligence they have inside Red Hat insights versus where the automation AI of anible automation you know that where all that technology is merging. Okay.

Jeff Ekstrom: Well, you know, I can tell you from a general sense uh that that typically we're we're driving towards integration between our management tools and our platforms. Um so that excuse me so that something that is you know how within within insights right now um if insights detects that there is uh that there isn't an ongoing issue you can integrate that with anible automation platform now and basically say hey you know this driver needs to be updated or you're going to have XYZ issue here's a playbook let me feed it into auto you know AAP and then it's up to you depending on your configuration and your own governance for for how you do change to actually execute that uh things like light speeded and I don't want to spoil the movie but when we talk about insights deployment planner these two things will work in concert as well to help you manage the uh overall product roadmap and uh life cycle of the applications and the operating system that you're deploying and then you know I would I would say that I

00:09:33

Jeff Ekstrom: could imagine that uh just as insights is feeding into AAP for some known issues within your environment and kind of giving you that automation framework that you need that this would factor into that as well as you build things and deploy things. So,

Ira Fox: Right. So let me so let me so what I do think will be interesting um a lot of our developers are not Linux savvy

Jeff Ekstrom: yeah.

Ira Fox: you know and so with if a developer we handle we usually will spin up a developer you know through automation a Linux VM a and right after you you can expect them hit you up directly with teams chat saying hey um how

Jeff Ekstrom: What?

Ira Fox: do I do this you know something how do I get something something something how do I get podman working how do I build a container on this and you know and so we have to go through the different things there's docker there's podman you know normal stuff

Jeff Ekstrom: Yeah.

Ira Fox: so if it from a developer perspective you know once they log in will they be able to use light speeded to say how do I use podman on real 10 or what's the best way to build a container on real 10 will it answer those questions or is it really very specific to how do I enable How do I create a new service under systemd?

00:10:51

Jeff Ekstrom: No,

Ira Fox: You know

Jeff Ekstrom: it'll

Ira Fox: that

Jeff Ekstrom: it'll answer those questions. That's a great use case for uh real light speeded and uh and you're actually the first customer to bring that up, but that is that's a great point that um you know that that your your developers are not going to be as you know systems systems admin savvy as as you all are. And so that turns into a lot of uh a lot of oneoff pecking and hunting talking to you folks. Um and they certainly could use rail light speeded um to kind of spin that up more quickly and and you know to take a little bit uh to give you all back some of your time as well. It'll be a win for both of you.

Ira Fox: There we go.

Jeff Ekstrom: Awesome. Awesome. Well, any other questions on light speeded? All right. Well, let's move on to the next topic. Um this is something that is available in the later versions of RE 9 as well.

00:11:42

Jeff Ekstrom: Uh but it came out of tech preview in real 9 and it's really really well baked into RE 10. And what we're talking about here is image mode. Uh so with image mode you can contain drift and accelerate delivery. But really what does that mean? That means that I'm going to manage the underlying operating system image the same way I would a containerized application image. Are you all building any containerized applications today? Are you doing anything with like Kubernetes or anything like that?

Ira Fox: everywhere we are.

Jeff Ekstrom: Okay. Well, good.

Ira Fox: Um, I can't speak to what what HCL team sees on their side, but on in a PD side, you know, they're finding it cheaper to build some of the modern products locally down on on like using Podman and Docker, but then deploying in Kubernetes up in Azure.

Jeff Ekstrom: Oh, sure. Sure. and and anybody on here that's from HCL, you know, this uh we invited you all here as well to be able to ask questions and learn about what you're delivering on on behalf of Blue Yonder.

00:12:39

Jeff Ekstrom: So, feel free to feel free to chime in with your own thoughts or questions if you have them. But anyway, okay. So, what's exciting about that then is you're managing the operating system image uh in a similar way to you would a containerized image. We know that when we build a containerized application, we make changes to that application at at the at the time that we create the image. So I might create my Apache image 1.0 and uh load it with certain dependencies and libraries and then boom, I launch my website. when I decide it's time to apply a patch or you know apply some uh configuration changes to the way that my web server is dep uh is configured um or designed. You know what I'm going to do is I'm not going to go to the running system and update it there. I'm going to create a net 1.1 or 2.0 or whatever you want to call it version of that same running image for my application. And then I'm going to let the automation within Kubernetes redirect uh redirect my users to the new version of that website.

00:13:40

Jeff Ekstrom: And you all know there's a lot of downstream effects of that and improves security. Uh it allows for things like easy rollbacks and AB testing and and there's just a lot of there's a lot of benefits to deploying applications in Kubernetes and then taking advantage of the immutability of a of of an image that runs within there. When we do the same thing with re, you're going to realize a lot of the same effects. By being able to do this, you're going to harden the overall security posture. I'm not patching a running system. I'm updating an operating system image and I'm allowing Kubernetes to then make that switch on my behalf. Uh, I'm going to be able to do rollbacks a lot easier. So, I'm going to be able to patch things. They say doing it like your smartphone. I think that might be promising a bit much, but I think the overall idea that you'll be able to automate the updates to your running operating systems, the deployment of those updates, the testing and promotion of those updates is a powerful is a powerful message to tell in the first place.

00:14:40

Jeff Ekstrom: Um, and so that's really what we're doing with image mode is giving users the ability to manage things similar. Thank you, Justin. To manage things similar as

they would a containerized application. So that being said, is this something like how are you doing your image management today? And where do you see value in image mode? Is it something you've already played around with?

Ira Fox: So to answer your question around image mode um no we have not used rails image mode we have what's called packer we have what we call packer pipelines that

Jeff Ekstrom: Okay.

Ira Fox: build our our server images for VMware um with respect to the like the it has our own kubernetes clusters we use rancher Um and the container images that we're maintaining to support automation and some other things are we're using a combination of Harbor IO for the container registry and GitHub actions to automate that pipeline. Um, but I would be more intrigued to understand and I haven't really read up on this and so that I don't want to bog the call down but I'm curious know when you say container with respect to the op so if you have a if you want to deploy a real 10 VM are you should are you saying that now you're deploying a container

00:16:03

Jeff Ekstrom: Well,

Ira Fox: as

Jeff Ekstrom: there

Ira Fox: an

Jeff Ekstrom: is

Ira Fox: initial

Jeff Ekstrom: still

Ira Fox: I

Jeff Ekstrom: well

Ira Fox: mean

Jeff Ekstrom: you have the option to do it that way. You can still deploy RE 10 the way you would have traditionally develop deployed a RE 9 or god forbid a different version of Linux uh before but you also have the ability now to utilize the container tools and make them more uh uh and and and utilize that automation that exists within there. So you have the option now. And that's that's really what they're saying is they've kind of formalized that. They've tested it. They've made it something that's production ready. And uh and it's something that you can do now. So So you can you can still do it either way.

Ira Fox: Okay. I I think you know from a HCL up I it infra supporting VMs I'd be curious to know how that works you know not from a Kubernetes container perspective but from a being able to better manage operating systems because I I I'll be honest it's one of our

biggest pain points is dealing with having to patch all these VMs all the time.

00:17:07

Jeff Ekstrom: Okay. Well,

Ira Fox: You know, our security team definitely wants to have a cadence of like weekly updates. Well, obviously that's hard when some of our teams support customers who don't want to upgrade.

Jeff Ekstrom: sure thing. So, so, so Ira, would you be interested in having a follow-up session? um we can bring in someone that specializes in image mode and have a discussion specifically about this about this topic.

Ira Fox: I don't want to speak for everyone, but I certainly would be interested. Um,

Jeff Ekstrom: Okay.

Ira Fox: why don't we do this? Let

Manikandan R: But

Ira Fox: me

Manikandan R: but

Ira Fox: read.

Manikandan R: we are

Ira Fox: I'm sure there's some stuff. I mean I honestly I was just inferring the image mode really around containers

Jeff Ekstrom: Mhm.

Ira Fox: you know and supporting you know IBM's investment which is supporting open shift and that's fine open shift is an awesome solution but um you know from a real 10 VM perspective I that I did not read on

Jeff Ekstrom: Okay.

00:18:13

Jeff Ekstrom: Well, sure then. Well, what what I'll do is um uh you know, go ahead and do some of your own research. We'll check back in with you, you know, maybe like in a week.

Ira Fox: And if you guys have links for people using real 10 in image mode on VMware um in in Azure, you know, under IS under standard compute, not AKS, but you know, I'd be curious to see what, you know, what what it can do for you.

Jeff Ekstrom: Okay.

Ira Fox: or did you misspeak? It really isn't for VMs.

Jeff Ekstrom: Well, it would be running in you can use real 10 in in something like VMware with the traditional mode, but you can also use image mode to deploy it into an infrastructure that can actual manage that can manage uh that can manage containers themselves. So,

Ira Fox: Okay. So, so

Jeff Ekstrom: image

Ira Fox: image mode is not really for for traditional VMs.

Jeff Ekstrom: Yeah. No, that's why there's still a mode for traditional VMs and

Ira Fox: Okay,

00:19:13

Jeff Ekstrom: and

Ira Fox: that okay.

Justin Deffenbaugh: It's image mode is a a set of tools to help you uh manage base image, manage gold images, right? Uh we have a lot of customers that will get a rail image that has their configuration, their packages, whatever kind of whatever makes sense for them to have as a base and then they stick that up in the cloud and then day two is something like anible or something like that to manage it going forward. Um image mode is a set of tools designed to make processing that image easier.

Ira Fox: Yeah.

Justin Deffenbaugh: It's more container-like. It doesn't necess it doesn't really have to do with containers. It's just uh similar management styles.

Ira Fox: Okay. So, yes, I actually have I have read up on image management. Um but because we don't we support more into just Red Hat we we tend to prefer packer you know because it's it's a single line it's the same code you just switch the the specific configurations that that's why I was wondering I thought maybe there was something new or different with R 10 that you guys were doing that's why I was asking those questions

00:20:20

Justin Deffenbaugh: Well,

Ira Fox: okay

Justin Deffenbaugh: it

Ira Fox: I

Justin Deffenbaugh: it is new. It isn't a new tool set. We've been developing tools that let you sort of uh manipulate images without having to mount it or open it or install it anywhere. And image mode is that plus a little bit more.

Ira Fox: I would be happy if you guys could figure out the stupid rail licensing in Azure. It's definitely not fluid.

Jeff Ekstrom: Yeah, I know we've had that I know we've had that conversation with you before about the about the Azure images and we can certainly

Ira Fox: All right.

Jeff Ekstrom: we can certainly follow up on that again. But why don't we do this? Why don't we why don't we check in on this topic in like a week and we can bring in we can bring in someone to have a focus session on image

Ira Fox: We

Jeff Ekstrom: mode and

Ira Fox: we we

Jeff Ekstrom: you can really

Ira Fox: pro unless HCL is interested we probably don't only because right now because we are supporting a whole bunch of different operating systems not just real like

00:21:14

Jeff Ekstrom: Yeah.

Ira Fox: I say we use packer

Jeff Ekstrom: Okay.

Ira Fox: but definitely

Brad Childress: Hey,

Ira Fox: appreciate that

Brad Childress: hey, Era. Just just real quick, going back to I think one of the earlier comments you made about managing operating systems. Um, was that in reference to to your team or was that um specific to HCL as far as finding a better way to do that,

Ira Fox: um we manage it manage different operances in Windows, Abuntu,

Brad Childress: right?

Ira Fox: Red Hat, AX, Solaris,

Brad Childress: Sure.

Ira Fox: HCL manages subset of those I'm sure or maybe the same I don't

Jeff Ekstrom: Awesome.

Ira Fox: Now, if you guys could figure how to containerize AS400 applications, so if we could get rid of the AS400, we'd be happy.

Justin Deffenbaugh: Nope. Nope.

Jeff Ekstrom: Awesome. All right. Well, it sounds like image mode definitely has some relevance. It might be um

Ira Fox: Hey, I think the HCL person dropped off.

Jeff Ekstrom: Okay.

Brad Childress: We lost him.

Jeff Ekstrom: Yeah, but it sounds like image mode has some relevance.

00:22:20

Jeff Ekstrom: Um, maybe it also sounds like you're doing some things already that kind of take its place and uh I know from from talking to you before that you've got a a dependency to manage a lot of different images or a lot of different uh distributions I should say. So uh let's move on from this topic but I but I do think there's some value there. Um so the next thing we talk about is making better decisions at build time. What we're really talking about here is insights deployment planner. Uh what this can do is it can work with uh in concert with real light speeded uh make package recommendations for an application that you are deploying and then be able to pull together product life cycle and roadmap details to help you avoid potholes in the road to help you avoid upcoming technical debt. So you're installing an application, you know, you have certain package dependencies, maybe a package is deprecated, maybe it's upgraded in a in a major way in an upcoming uh minor version release of the platform itself.

00:23:18

Jeff Ekstrom: You know, one of the things that insights can do is it can kind of spell out for you. It can kind of spell out for you where those where those potential pitfalls live. And when you have that information ahead of time, we all know how that is. If we build an application on a particular platform and everything is great and then one day something major changes that we were not um aware of, you know, or because you know there's a million things that could change that could affect, you know, what it is you're deploying. It's hard to really stay on top of every single detail. This is a tool that can kind of help you see those details and illuminate them for you before you run into those issues. So, it really helps. And I always like to tell a story. I worked with a banking customer last year. They were running an application on re six and they were stuck in the mud and they were talking to us about how do I get off of six and then on to seven

and on to eight and you know we had that technical conversation with them around the tooling and the automation and considerations and all that sort of thing but one of the things the customer said to me was you know I feel like in a

00:24:22

Jeff Ekstrom: year from now I'm going to be stuck in the same problem burning the same cycles trying to get off of seven or trying to get off of eight and it's going to be the same thing all over again and I wish there was a way that I could just kind of see what was happening before it happened and I could make a plan and that was the first thing that we talked about at the time even though then it was not even tech preview was just that a general theme of what's coming in real 10 is around being able to plan for the roadmap and plan for the product life cycle and then kind of move forward move forward with a better idea of what lays ahead of you. So you know that's kind of the idea there and once you know once you kind of get into that one of the things you can do is with image mode you can take your pre hardened images and you can reduce time to you know do things like join domains and then all of this stuff together gives you the ability and I'm sure with packer you're doing some of this yourself but to securely build automate you know a software bill of materials for my actual operating system image as well but but back to insights deployment planner um is this something where you kind see value in this today.

00:25:27

Jeff Ekstrom: Um, are you kind of struggle with some of those same roadmap considerations? Uh, that sort of thing.

Ira Fox: Well, the inter the first piece of it, the shift left and in the sense of it being able to make recommendations based on packages, that's intriguing because as as you all know, we have I was on a I thought the meeting was called Rail 8 with product development and I

Jeff Ekstrom: Yeah.

Ira Fox: was going to give my spiel about why we should be moving a real eight to real nine. And this was actually a month and a half ago. So this wasn't that long ago. I had this discussion and it turns out it wasn't about real eight. It was about real seven and

Jeff Ekstrom: So

Ira Fox: why they still needed it. And it's like oops you guys realize we don't have any

extended support for real n I mean seven. So I'd be kind of curious. You know, the problem I see, the challenge I see is that a real 7 can't talk to Insight right now.

00:26:28

Ira Fox: So, this would only work in a real 10 unless unless you're saying there's a way to like ingest a real 7 VM to say, "Guys, this is how your tech this is what you need to do kind

Jeff Ekstrom: Well,

Ira Fox: of thing."

Jeff Ekstrom: let me show you. I actually had a slide on that. Um, let me let me me share this instead. So,

Ira Fox: I mean, that's

Jeff Ekstrom: this

Ira Fox: something we could share with PD if it really could do something like All right.

Jeff Ekstrom: Yeah. So, this is something and I think that this would be another thing that uh we could we could have both Justin and we've got a specialist Pete that could talk about this in more detail. Uh but we basically do have an insights advisor in satellite. We've got an on onrem plugin. Um I in terms of the insights functionality that they're shipping on prem initially you know this is something that you know we'd have to get I don't have all the detail on that but the idea here is that if you're not connected to insights on the internet uh but you are a satellite user there is a way there there is a way that uh that you can still use insights in an offline capacity and then apply that to whatever systems you're running.

00:27:33

Jeff Ekstrom: I do think we would need to have a something more focused on this one because um you know I can't tell you exactly every feature that's available in it but I can tell you that in a general sense uh most of the uh most of insights advisor should be available in an offline uh capacity. Justin do you have any more on this or um is this a good Pete topic?

Justin Deffenbaugh: This is uh pretty new. I haven't had a chance to play with the offline version of Insights. Um I just want to make sure I heard correctly. you you were talking about having a hard time getting your real seven boxes in insights. Is that because they're offline? Is that

Jeff Ekstrom: Well,

Justin Deffenbaugh: the

Ira Fox: No,

Justin Deffenbaugh: detail on this?

Ira Fox: roll 7's not supported anymore.

Justin Deffenbaugh: Okay, let me that's news to me. Uh far as I know, it's everything after 6.4 is supported,

Ira Fox: Oh,

Jeff Ekstrom: yes.

Ira Fox: it's supported if you pay for it in a very expensive.

00:28:26

Justin Deffenbaugh: right? ELS. Okay,

Ira Fox: Yeah.

Justin Deffenbaugh: fair enough.

Jeff Ekstrom: Yeah, it's not supported at Blue Yonder, right?

Justin Deffenbaugh: Yeah.

Jeff Ekstrom: Okay. Well, um, yeah, as far as your RE7 systems, I'm assuming that that you're not you're not patching the systems that are in existence now, but they're but they're not exposed to the internet either, and maybe that's the strategy to um to avoid that.

Ira Fox: Yeah. They're not exposed to the internet. They're on a what we call our private subnet, but it's not really that private because it's got to be able to talk, you know, to share database servers, file servers, you know, the normal

Jeff Ekstrom: Yeah.

Ira Fox: stuff.

Jeff Ekstrom: Well, why don't u what we could do with this

Ira Fox: But

Jeff Ekstrom: is

Ira Fox: that, you know, we are we are definitely using Red Hat satellite. So, um I I don't know of HCL. I think they are not sure actually because they have a different kind of a licensing agreement with you guys. But for us, we are definitely using satellite.

00:29:17

Brad Childress: Yeah, the HL team is not using datalite. Um, unless they're using the upstream version of foreman, but they're not using the supported version. I'm not sure if a detail if if you have any more details All right.

+1 585--59: Okay. So, so

Aaditya Thakur: Unfortunately, I

+1 585--59: um

Aaditya Thakur: don't have

+1 585--59: so

Aaditya Thakur: the

+1 585--59: okay. So,

Aaditya Thakur: uh

+1 585--59: so it is Rahul um from so in cloud cloud side of the house we have about 3,500 plus R7 and uh most of those are basically uh meaning yeah end of support and I think we recently uh requested um RGL to you provide the uh you know enable the uh ELS support for another year. Uh so I think in reference to uh I mean so here right one thing to clarify uh for the RHL team that we are talking about two blunder teams one is the blunder corporate which fox and team represent

Brad Childress: Yep.

+1 585--59: and other uh you know the cloud part that we represent is a bigger piece where we're talking about 10,000 plus you know RHL servers hosted in private and public cloud.

00:30:28

Brad Childress: Heat.

+1 585--59: So this RHL7 piece in by environment that support from the cloud side of the business which is which is basically the customerf facing business where you know all of the by products are hosting and their end customers are using those

Brad Childress: Yep.

+1 585--59: that has this RGL7 piece u which we need the ESL ELS support but currently what is happening uh while we enable the EL uh ELS support for these uh 35 plus or basically those are 38 I think 30 3500 or 3,700 systems while we do that by is actually in making invest and and then most of these on all of these systems are basically sitting in believe under private cloud right meaning the the physical data centers not in the in the Azour or or or so so by is actually planning to upgrade these systems uh to the next release. So basically there is a project BY is opening uh or we are actually working on

where by is going to upgrade all of them to the latest and greatest or or to the RHL version where uh what I would say the BY solution is supported.

00:31:48

+1 585--59: *So obviously it is not going to be RH7 or any unsupported version. So there will be a mass effort of you know these 3,500 uh RHL systems being upgraded um to the supported one in next 2 years and it is not just um by is doing specifically to upgrade the RHL systems but uh the by goal is to migrate from the private cloud and move everything to the public cloud where we have you know RHL entitled subscriptions already in place. So it's anyway going to be um you know*

Brad Childress: *Okay.*

Ira Fox: *So it*

Brad Childress: *Anything*

Ira Fox: *sounds so that means all your systems are are registered with cloud basic with um not cloud excuse*

+1 585--59: *yes*

Ira Fox: *me the on the online version if you will of satellite I forgot what*

+1 585--59: *we*

Ira Fox: *it's*

+1 585--59: *use we use basically big fix to patch our systems.*

Ira Fox: *All right. Which, ironically enough is an IBM product. Although I didn't*

+1 585--59: *Yes.*

Ira Fox: *or did IBM*

+1 585--59: *which which*

Ira Fox: *resell*

00:32:53

+1 585--59: *used to*

Ira Fox: *it.*

+1 585--59: *be yeah which used to be the IBM product that SCL bought.*

Ira Fox: *Okay.*

+1 585--59: *So it is yeah it is basically big fix is now uh software product.*

Ira Fox: *All right. So where I*

+1 585--59: *So*

Ira Fox: don't know if you caught why was we were asking about this stuff is because if it has the ability to um look at your VM look at all the packages that are installed and kind of give you like some analysis but you know hey you're using this this this and this um these are going defunct like if you're still using the old Python code that that

+1 585--59: *Mhm.*

Ira Fox: *the Python community doesn't support anymore or Postgress or or whatever whatever it might be. You know, you might want to*

+1 585--59: *Mhm.*

Ira Fox: let the developers know that.

+1 585*-59: *Mhm.*

Ira Fox: That's what I was kind of looking at because, you know, a lot of times we always hear from developers, well, we can't upgrade to rail 7, rail 8 or whatever it is because such and such and such tool.

00:33:50

+1 585--59: *Yeah. Yeah.*

Ira Fox: *So,*

+1 585--59: *So I I I I'll tell you the the upgrade path is basically decided. So all the RHL7s are going to go away and BY is going to build a parallel uh RHL8 or or greater um in next two years. So it is going to be the fresh build and bases upon the RHL version not basically the RHL*

Ira Fox: *So,*

+1 585--59: *version.*

Ira Fox: *so that's exactly the problem. Okay.*

+1 585--59: *Mhm.*

Ira Fox: Um, real eight is going to be coming the rail 7. No, with real 10 being G.

+1 585--59: *Mhm.*

Ira Fox: *RA 9 will become what RE 8 is now. Kind of like the the older brother that's mature. But real*

+1 585--59: *Mhm.*

Ira Fox: 10 is going to be that shiny new one. So

+1 585*-59: *Mhm.*

Ira Fox: that's the problem is the cadence has to be faster nowadays. And I know it's hard because I I believe you me I I've been in your on your side as well dealing with

00:34:45

+1 585--59: *Mhm.*

Ira Fox: *production customers*

+1 585--59: *Mhm.*

Ira Fox: and you know it's not that easy when you have all these customers and you don't want to keep on upgrading because that introduces change

+1 585--59: *Yeah.*

Ira Fox: *and introduces risk.*

+1 585--59: *Yeah. Yeah.*

Ira Fox: But yeah

+1 585--59: *And*

Ira Fox: *so*

+1 585--59: *most*

Ira Fox: the

+1 585--59: *of it Yeah. Most of it I would say deciding what RHL version we going to go.*

It's not basically the infrastructure team decides basically this

Ira Fox: *Oh,*

+1 585--59: *group.*

Ira Fox: well, I

+1 585--59: *It*

Ira Fox: *know*

+1 585--59: *is*

Ira Fox: you

+1 585--59: *all*

Ira Fox: *guys don't decide.*

+1 585--59: *all*

Ira Fox: I

+1 585--59: *PDS*

Ira Fox: *believe me,*

+1 585--59: *right.*

Ira Fox: I've

+1 585--59: *Yeah.*

Ira Fox: *had these conversations with product development,*

+1 585--59: *Yeah. Yeah.*

Ira Fox: you know. Yeah, I

+1 585--59: *Okay.*

Ira Fox: *III feel your pain. II know.*

+1 585--59: *Yeah. So*

Ira Fox: And
+1 585-*59: it

00:35:20

Ira Fox: I
+1 585--59: *is*
Ira Fox: *think*
+1 585--59: it
Ira Fox: some of
+1 585--59: *is*
Ira Fox: *these*
+1 585--59: basically
Ira Fox: guys from
+1 585--59: *the P.*
Ira Fox: *Red Hat*
+1 585--59: Yeah.
Ira Fox: have
+1 585--59: *PD*
Ira Fox: *been on*
+1 585--59: is here.
Ira Fox: calls with them, too.
+1 585--59: *Yeah. Yeah. So what are we so what are we you know trying to accomplish meaning um you know meaning*
Ira Fox: *So*
+1 585--59: um
Ira Fox: this this calls about real 10 and what what what advanced features or what you know features it has beyond just being just a basic Linux operating system running on Linux kernel.
+1 585-*59: okay gotcha
Jeff Ekstrom: Yeah, it's just a roadmap session and we're just talking about what's new in the newest release. Um, so, so Ira, I think this is something, you know, this is a tech preview thing, but I think this is something that would be of value to you to at least kick the tires on. Why don't I take this offline to get you some more information on how you set this up and what you can and can't do with it.

00:36:06

Jeff Ekstrom: And then from there, I would encourage you to just try this out in a in at least like a lab environment and get a feeling on whether or

Ira Fox: Yep.

Jeff Ekstrom: not it's useful to you.

Ira Fox: Definitely.

Jeff Ekstrom: Okay, cool. All right, so we've got two slides left and I we're running a little a little uh a little slow today. So, let me get through these last two slides. I'm glad everyone finds some value in this and uh hopefully the offline version provides, you know, most of what what you need. So the last two topics should be relatively quick. The first is talking about uh postquantum uh capable uh algorithms. So with quantum computing, one of the things that you find is that uh standard a lot of your standard encryption algorithms like SSL and FIPS uh can be um or not the FIPS is a as a as a encryption standard but anyway uh these can be um decrypted in a fraction of the time uh that would typically take place. And so what Redhead is doing is your enterprise Linux vendor is coming up with the first uh postquantum capable resistant algorithms.

00:37:11

Jeff Ekstrom: Uh and as you can see below uh there's going to be you know we expect future compliance mandates around those standards uh FIPS modules FIPS cryptographic standards. But the idea here with quantum computing is to be able to resist you know is to be able to stay in front of the new security threats as they become a thing. Is this something is all of this kind of like you know quantum uh quantum resistant algorithms and encryption standards is this something that's on your radar today or is this something that maybe is a little far out

Ira Fox: I think yes and no. I mean I'm not so concerned about quantum right today. Um in fact one of our really talented DevOp programmers within it infer when to go work for a company that does this the quantum computing. So, it's kind of cool stuff, but I do think from uh, you know, any type of security compliance standards, you know, we definitely want to loop loop in some of our technical security folks so they know what's coming, you know, from real 10.

00:38:18

Jeff Ekstrom: Okay. Awesome. All right. Well, we can um you know, we can keep this one. We we

Ira Fox: But

Jeff Ekstrom: can

Ira Fox: I'm

Jeff Ekstrom: keep

Ira Fox: not losing sleep that that that someone with a quantum computer is going to hack into Blonder today. We have other challenges. We just we just have people.

Jeff Ekstrom: Yeah. And that's that's always the way, right? Uh but you know, Red Hat's trying to stay in front of these things before they do become a problem. And that's why

Ira Fox: Oh

Jeff Ekstrom: we're

Ira Fox: yeah.

Jeff Ekstrom: that's why we're the

Ira Fox: If

Jeff Ekstrom: uh

Ira Fox: you could fix the human problem, that would be awesome

Jeff Ekstrom: Yeah.

Ira Fox: when it

Jeff Ekstrom: Well,

Ira Fox: comes when it comes to cyber security.

Jeff Ekstrom: yeah. Yeah. Oh, that's for sure. That's for sure. Okay. Well, you know, that's and this is common. I I hear that from a lot of customers as well that uh that what they're doing with um with their own security stuff that's usually it's a couple of mile posts past where they are right now.

00:39:10

Ira Fox: out of curiosity um are are you all testing and and we are under NDA but um are you testing when you say you're preparing for quantum hacking does that imply that you guys have access to quantum computing You need to test hacking.

Jeff Ekstrom: Well, I would what I would say is that we we can't very well design quantum resistant algorithms without the ability to test that sort of thing. Now, what kind of resources our product business unit are are incorporating into that? I I couldn't tell you specifically, but I would think

Ira Fox: Okay.

Jeff Ekstrom: the implication would be that I can't really tell you something's quantum resistant unless I can test it.

Ira Fox: You'd be surprised. cuz all you have to do is go and chat JBT and it will come up with anything you tell it.

Jeff Ekstrom: Geez, I sure I sure hope our I sure hope our product business unit isn't isn't doing that. But uh

Ira Fox: I

Jeff Ekstrom: you know

Ira Fox: mean it's cool stuff. I I mean it is really cool if you guys are doing that.

00:40:08

Ira Fox: I just

Jeff Ekstrom: Yeah.

Ira Fox: I

Jeff Ekstrom: Well,

Ira Fox: I I've been I've seen other companies not you guys particularly CA unicenter you know you remember computer associates.

Jeff Ekstrom: yes. I remember where they they uh where your code it goes to it goes what's the word for it? I used to do work at the mainframe guys. They'd hold your uh hold your code hostage.

Ira Fox: Yeah.

Jeff Ekstrom: That's right. That's right. Anyway, all right. Well, that's great. And what we'll do is I'll try to get you an answer on that as well as to how they actually go about that uh how they go about designing those uh or what they will tell us on that part. So the last part uh that we want to talk about today is around using re as a trusted uh AI foundation. So one of the things when we did we did when we designed re we kind of pioneered the process to take something from upstream project to enterprisegrade product.

00:41:00

Jeff Ekstrom: So you know we went from upstream Linux to to re as an enterprise foundation for your business. And one of the things we did along the way was kind of pioneered having that uh partner ecosystem in terms of software and hardware vendors that were uh certified to work with the operating system itself and it could lead to a you

know a much easier result for Linux in general in terms of I know I can deploy this database on this rail on this server and it's going to work and previous to that was not something that was um that was such a given in the Linux world prior to prior to that such it is with AI with Red Hat's partner palidation program we can do the same thing for AI hardware and software and there's a good tremendous amount of that on the market today so this really is an accelerator for being able to onboard new AI projects when you look at our extensions repository it's the same thing with community content uh there's community content that is trusted by Red Hat and so then you're able to even though this is not necessarily a product it something that Red Hat has some sign off on similar to what you see with RE in a general sense with RE software collections where there's a number of uh upstream pieces of software but but Red Hat knows that these particular versions work well or have been tested with the platform uh then as

00:42:23

Jeff Ekstrom: an extension of that you know once I can pull in once I can pull in my content and I know that the hardware and the software is going to all work in concert with the OS then I can go around actually developing my AI capabilities. uh you know I can simplify the management with podman. I can streamline deployment of my images with image mode. And then finally, I can use the building blocks like the vector database extension to improve my accuracy and uh you know and and have support for uh my you know context protocols being able to add in specific capabilities. And then finally all of this together one of the features uh in real 10 kind of maybe they should have included this on the quantum computing slide but it's to protect data in use with confidential computing support. And so you know I encrypt data at rest. I encrypt data in flight. Uh but with this confidential computing this is a requirement for a lot of customers. I can encrypt data while in memory as well.

00:43:19

Jeff Ekstrom: Uh so it's just a matter of how sensitive the data is. But to back up from that and to focus on AI where do you see value with this today? What are you all using for AI? What is kind of like your general direction going to? I know that from looking at your product page, you all have a lot of AI extensions for your end users uh for for Blue Yonder as a product. I know, you know, because all the supply chain optimization, that's a great uh that's a great use for like the predictive AI models. Um, but anyway, kind of

looking at this from a general sense, like where are you today with like your AI tooling and what you use and where do you see uh if at all um something like Red Hat with Open Shift and RA kind of fitting into that

Ira Fox: So definitely outside the scope of HCL and IT infra teams. Um, we actually do have dedicated AI group who focuses on on that type of stuff. So, I I I'm not going to misspeak here.

00:44:21

Ira Fox: I I can tell you I'm really intrigued in it. you know, there's different projects I'm looking at like kube, like Kate's GPT and things like that to help, you know, managing Kubernetes because I, you know, right now I'm managing RKE as well as AKS up for our BISAPS team and but and bottom line is right now all of our AI seems to be running primarily in Azure. though I can tell you that you you guys know that Azure is a huge partner of Lehighers.

Jeff Ekstrom: Yes.

Ira Fox: Um I'm not going to go into why it's not my pay grade.

Jeff Ekstrom: Yeah. Okay. Well, and that's fine. And and you know, we find this a lot that what the what a you know, and and I I've been selling myself. I've been selling AI for some variety for for years now. And so it's funny when all the chat GPT stuff came out and everyone said they were gonna finally have AI, it was always like you've had AI all along, you know, you just didn't believe.

00:45:27

Jeff Ekstrom: But anyway, um well, we can uh we could certainly have this conversation uh more with the the users that would work on it and and we do we are pretty well aware of your Azure partnership. So um but this is

Ira Fox: Yeah.

Jeff Ekstrom: um but this is still an interesting feature. So and and we're almost out of time so I don't want to belver the point. Go ahead.

Ira Fox: Yeah. I mean I mean it I I know some of us are interested in generative AI and what we can do with it infrastructure and automation.

Jeff Ekstrom: Yeah.

Ira Fox: Um but we all know that IBM is not giving away AI for free. You know you can give tools but the big problem is actually

Jeff Ekstrom: Heat.

Ira Fox: the engine itself you know hosting that kind of thing on prem. I don't think that's what you're suggesting here with real 10, right?

Jeff Ekstrom: Yeah. No, not necessarily. I mean, with Re 10, you can import your own language models and a lot of customers, you know, you've got your internally developed language models that that understand your specific and or you know, have some of your own business sensitive data inside of them.

00:46:36

Jeff Ekstrom: And what RE10 is supposed to do, one of its key features as far as the AI infrastructure goes is kind of being that that conduit to implement those language models internal to your own organization. And the other thing that Red Hat does is for external models that you know I you know I've seen this a lot where customers will want to marry pieces of their data with some external data like think of an insurance company. They're going to have their own uh risk evaluation, but they're also going to need information on when a car gets stolen or when an accident happens. They need to be able to marry those two pieces of data together to then uh to then perform um some sort of visualization. Um and and with Red Hat, with the external stuff that we do, you know, with a lot of the community content and language models that we do make available, uh you know, we have an identification process, uh for the customer themselves to say, "Hey, this is something that Red Hat's certifying that we've tested that we know is good, that we know is not a not a security risk, that sort of thing.

00:47:36

Ira Fox: So beyond you know some of the the cooler things like AI and some of this stuff like like light speeded are then there other major changes in real 10 um kernel versions file systems the default file systems um better ways to manage RAM This

Jeff Ekstrom: Yeah.

Ira Fox: kernels, any of that stuff.

Jeff Ekstrom: Yeah. I'm I'm putting together a list of that. You're you know, you're u the different customers asked that question different ways. I was asked yesterday, what are some of the upgrade gotchas? you know, they went from this customer went from seven to eight and then 8 to nine and you know, potholes again, t debt again. So, they asked, "Well, what's it like going from 9 to 10? What are some of the gotchas?" And so,

I'm actually working on a document on that. I've got about 20 links right now, and I want to make it a little bit more um digestible. So, why don't I take that offline when I get my document created? I'll go ahead and send it over to you, and you can just kind of review.

00:48:34

Jeff Ekstrom: There's a lot of stuff in there,

Ira Fox: Okay.

Jeff Ekstrom: so you know what I mean. And

Ira Fox: Yes.

Jeff Ekstrom: and I wouldn't say that when I say there's a lot of stuff, I don't mean going to real 10 is going to be some huge ordeal. I just

Ira Fox: It sound like when we switch from system five or in it to system D, the whole world blew up for a bit.

Jeff Ekstrom: yeah, the whole world did. I don't expect the world to blow up here, but but there are a lot of things to think about and you know, I want to curate this a little bit because there is a difference between what really matters. It depends on how deep close you look at the page, right? So, let me get you let me get that to you offline. Okay.

Ira Fox: Yeah, sounds good.

Jeff Ekstrom: Well, awesome. Well, we're down to the last four minutes. Uh, first off, I appreciate everyone's time today from all around the world uh for joining us and spend a little time talking to us. Um, before we close out the session, uh, are there any additional questions uh that you need of your Red Hat team? Anything else you want to know? All right. Uh, and then finally, Brad, Justin, uh, do you have anything else for the Blue Yonder teams?

Brad Childress: Oh, talking to myself on mute here. Um, no, I think this was super helpful. Um, sorry, I know we're going to send over a couple or maybe more than a couple links to you guys. Um, just for you to look through and digest on your own time here. Um, if there's any follow-ups you guys want us to take action on, whether it's more specific to AI or if it's just more basic stuff around integrating Anible or insights with satellite and anible potentially to help with some of the system management um, of operating systems, then we're happy to do that. Um, just let us know where you want to go from here.
