Panasonic Avionics planning session

Invited justin.rue@panasonic.aero [Jason Anderson](#)

Attachments [Panasonic Avionics planning session](#)

Meeting records [Transcript](#)

Summary

Meeting established project cadences and workshop formats while aligning on upcoming site visits and planning activities.

Operational and Workshop Planning

Bi-weekly calls are established. The team decided to prioritize a 90-minute walk-through for the Event Driven Ansible workshop.

Technical Discussions and Solutions

Molecule was proposed for unit testing and dynamic file editing. Automation possibilities for Service Now are under evaluation.

Scheduling and Future Planning

On-site visits are deferred to the week of June 22nd. External observation of PI planning sessions is being pursued for alignment.

Next steps

- [Jason Anderson] Send Molecule Info: Send information regarding the Molecule tool usage after the call.
- [Justin Rue] Confirm Visit Date: Get management approval and confirm the proposed onsite visit date of the week of June 22nd.
- [Jason Anderson] Plan Visit Agenda: Start game planning the agenda for the onsite visit once the date confirmation is received.
- [Jason Anderson] Schedule Follow-up Call: Send meeting invite for the bi-weekly call on the 19th at 3:30.
- [Mauricio Da Graca] Coordinate PI Attendance: Bring up request with Jake to allow virtual attendance for the PI planning session.

Details

- **Bi-Weekly Follow-Up Call Cadence:** The participants agreed to start bi-weekly follow-up calls, which Justin Rue proposed and Mauricio Da Graca confirmed would work for them ([00:00:00](#)). Jason Anderson noted this agreement, respecting that Justin Rue was feeling unwell during the discussion ([00:06:23](#)).
- **External Service Now Automation and Integration:** Justin Rue shared a new use case for automation involving an external Service Now platform queuing tasks that require manual action, which they believe could be automated internally ([00:05:11](#)). They raised a question about whether an individual user can obtain their own credentials to use the Service Now module, noting that they needed to defer to Ryad for a definitive answer on that technical path ([00:06:23](#)).
- **Scheduling the EDA Workshop:** Jason Anderson confirmed that the EDA workshop will be virtual and can be executed in two ways: a 90-minute session focused on spinning up the environment, or a longer, more technical discussion with Ramsey or Ry. Justin Rue confirmed they would prefer the walk-through option, which requires planning, and confirmed the focus should be primarily on EDA and NetBox ([00:07:33](#)).
- **Upcoming Call Topics and Dynamic Input:** For the next call, the topic of discussion will include the Service Now question and a question raised by a colleague about how Ansible could dynamically allow a user to edit a file, which Justin Rue found unusual since they typically follow a configuration-as-code approach ([00:08:41](#)). The user is interested in how a person can run a playbook and, if it fails, make changes on the fly without having to restart ([00:13:36](#)).

- **Addressing Dynamic File Editing with Molecule:** Jason Anderson suggested that the tool Molecule could address the need for dynamic changes by providing a way to conduct unit testing inside of Ansible. Molecule allows users to spin up a container, run a playbook against it, and make changes before committing the code, essentially serving as a development container for testing ([00:13:36](#)). Jason Anderson committed to sending follow-up information about Molecule, but noted the requirement to mimic the production environment within a container for testing ([00:15:09](#)).
- **Scheduling the On-Site Visit:** Jason Anderson proposed the week of June 15th for an on-site visit, but Justin Rue suggested pushing the date later due to internal events like a hackathon, the end of their sprint, and iteration planning occurring that week ([00:16:16](#)). Justin Rue proposed the week of the 22nd instead, which Mauricio Da Graca agreed was better to avoid interference with planning ([00:17:28](#)).
- **PI Planning and Red Hat Assistance:** Jason Anderson asked if they could virtually observe the quarterly PI planning sessions to better understand priorities and determine if Red Hat could offer assistance ([00:19:31](#)). Mauricio Da Graca agreed that bringing in a manager, Jake, to approve Red Hat observing the PI planning would be helpful for getting advice and potentially expediting priorities ([00:20:41](#)).
- **Final Next Steps and Commitments:** Jason Anderson will send an invite for the next call on the 19th and will wait for confirmation regarding the on-site visit date of the 22nd to begin planning the necessary agenda and approvals. Jason Anderson emphasized their availability as a resource for both Justin Rue and Mauricio Da Graca ([00:20:41](#)).

Panasonic Avionics planning session - Transcript

00:00:00

Jason Anderson: How's it going, guys?

Justin Rue: Hey guys, how's it

Mauricio Da Graca: Hey

Jason Anderson: Uh well,

Mauricio Da Graca: David.

Jason Anderson: happy Tuesday, almost the end of my day, unfortunately, lunchtime for you guys. Um but I I just wanted to follow up with you real quick, Justin, on about four different things. Um follow-up calls. We actually don't have any more planned. Um when would you like to start them and what would the cadence you would you like to have for those?

Justin Rue: you say like probably bi-weekly has has been good for us. What would you think? Do you agree more?

Mauricio Da Graca: Can you repeat that? I'm sorry.

Justin Rue: I was thinking bi-weekly cadence and like syncups if possible.

Mauricio Da Graca: Yeah, 100%. Yeah. Yeah. Yeah. Yeah.

Justin Rue: available.

Mauricio Da Graca: That works for me with my weekly. That works for me 100%.

Jason Anderson: Okay. Um,

Justin Rue: I like your I like your

00:02:46

Jason Anderson: you Oh, thank you.

Justin Rue: Jason.

Jason Anderson: I I will bring you one when we come out there. Uh, that's one of my next agendas. Hey, do you mind if I invite Rich Lavin into here real quick?

Justin Rue: No.

Jason Anderson: All right. Yeah, real quick.

Justin Rue: Yeah, it's kind of last minute. I added Mauricio and I do have a whole stack of them. And um you know in the future we could pull like on our side we could pull Matt White in um some other folks um just to get more people from our side working on this This

Jason Anderson: save. Come on, you can do it. Hey, I'm sending you the link right now. I I'll send you in Slack. Yep. Excuse me one second, guys. I'm sorry. I'm having technical difficulties here. Nothing is working for me at this second. All

Justin Rue: Okay. Yeah, I'm I'm you know,

Jason Anderson: right,

Justin Rue: it's kind of like I said,

00:05:11

Jason Anderson: let's do let's Yeah,

Justin Rue: I only have a

Jason Anderson: let's just go ahead and continue talking.

Justin Rue: few.

Jason Anderson: I'm taking notes and I will get Rich in here in just a

Justin Rue: Okay.

Jason Anderson: second.

Justin Rue: Yeah, I don't really have a pardon me. I'm not too talk every day. I'm a little under the weather, but uh yeah,

Jason Anderson: Okay.

Justin Rue: we're just we're just chucking along. Um I got I got a new use case for automation today. Um we've got some an external service now platform that is queuing up tasks that are then equating to Jerus that people have to manually action and I'm like the only one to speak up on the call I'm like come on guys we can do better we can automate this right um at least internally and then just figure out how to talk to the external Um, so yeah,

Jason Anderson: Okay.

Justin Rue: just just still tricking along. Um, you know, I think we're still working on the netbox integration. Um, we still need to get like one of the big things because I saw earlier was like they're in service now.

00:06:23

Justin Rue: I was like, "Oh, EDA done, right? Let's just get that done." and uh but it turned out to be an external service now. So I don't know if we can do EDA with an external service now. Probably not. I don't know how that works. But I'm thinking okay well if not then well then I'll just use the service now module right like can an individual user get their own credentials to use that module to manage their service now Thank you.

Jason Anderson: Why would No, I wouldn't go that route personally, but I I would want to defer to Ryad for that. Um I wanted to keep this a little bit higher level, Justin, than that. Um I I have just a a few simple questions.

Justin Rue: Sure.

Jason Anderson: Like I said, you said the bi-weekly, and I'm trying to respect the fact that you don't feel well. Um, last time we talked about the EDA workshop. Um, do you guys have a time frame for when you want to us to set that up?

00:07:33

Justin Rue: Is it going to be um virtual or

Jason Anderson: Yes, it will be virtual and we and we can do it two different ways.

Justin Rue: anything?

Jason Anderson: We can just if you tell us the number of people, we can spin up the environment and you can go through it and do it all probably in 90 minutes. Um, or if you want, we can take longer. Uh, we can bring in Ramsey and maybe even Ry if needed uh to, you know, discuss more technical aspects of, you know, what you guys are trying to accomplish uh with EDA and all of these things. Um it so it's depends on which way you want to go. You know it when you want it. If you want guys don't want to uh walk through uh we can do it anytime. If you want to walk through we need to plan this out.

Justin Rue: Uh yeah, I think we'll take the look.

Jason Anderson: All right.

Justin Rue: It's going to be that primarily focus on EDA,

Jason Anderson: take.

Justin Rue: right?

00:08:41

Justin Rue: More general anible

Jason Anderson: Yeah, the focus will be on EDA.

Justin Rue: Okay.

Jason Anderson: Um, actually it's EDA and netbox if you want to be very technical about it. Um,

Justin Rue: Oh, yes.

Jason Anderson: so, uh, the next thing I wanted to talk to you about is, um, next call, which would be, I guess, next Friday or two weeks from now, whichever you want. It doesn't really matter to me. Um, anything specific you want to cover? You just said, you said the service now question. Was there anything else? We can we can go with that for right now. If you come up with something else, just let me know. I don't want to stress anything out here. Um,

Justin Rue: Yeah.

Jason Anderson: last

Justin Rue: I mean a lot of people see me. You know what it was is um T asked me he says okay how he says okay you have a playbook they have a job template

Jason Anderson: Justin,

Justin Rue: I guess it

Jason Anderson: you're breaking up really bad, dude.

00:10:15

Jason Anderson: I'm getting like

Justin Rue: was just another automation use case I was asked how um Anible could dynamically like allow allow a user to edit a file.

Jason Anderson: dynamically.

Justin Rue: I thought that was weird.

Jason Anderson: Okay.

Justin Rue: I thought it was weird because like mainly we would just do configuration is code,

Jason Anderson: Yeah.

Justin Rue: right?

Jason Anderson: Uh

Justin Rue: We've got a lot of these configurations and right now as it is people go in and they edit it and so he was asking me and my thought is like we just have them going to Gitlab and all checked into game going you can um but his his ask was like directly to available would

Jason Anderson: Yeah.

Justin Rue: ask for like dynamic input like I know we have the surveys and but this

question and answer. Just kind of curious

Jason Anderson: I I I will have to think about that one. Um, and yeah, we can bring that one in. Uh, that should fill that should fill pretty much a good amount of

Justin Rue: ideally I don't think we even wanted to

00:11:22

Jason Anderson: time.

Justin Rue: bigger DNS views and a lot of management overhead. a lot of use for customers essentially doing custom name resolutions for different environments, right? And um and uh by like submitting and stuff like that and it's a lot of management overhead. It's a long history, right? So um the my my goal is to have everything as being configuration code meaning all the custom subnetting and I special sort of DNS goes into the structured vs right which is like you would currently group varss site and ultimately we want to get into networks. So that and then and then we just template that out and I change the templating and we'll just deploy do deploy. all the DNS configurations code. You want to make a change, you make no change in the code, right? But his question was like, well, we have some times when there he says, well, I have my my own little test IP and I want to modify the DNS just for me. And so his question was like how can this person go in and you know make a make a change for themselves and his thought was like how do you have anible let this person edit the film and I'm like no not really it would be more of a server delet more like add news change like that kind of stuff right from an perspective that we could do with dev templates, I'm sure.

00:13:36

Justin Rue: Um, just thinking through it. Um, and if there's a better use case, better way to do things, things things that aren't other

Jason Anderson: All right, let me let me make sure I have this. Um, you have a user who wants to run a playbook. If it works, great. If it doesn't, make changes on the fly without having to reboot things and start over. Is that this general gist of this?

Justin Rue: Yeah.

Jason Anderson: That's I mean that's the general idea.

Justin Rue: Yeah. Yeah.

Jason Anderson: All right, cool. So, uh, well, have you guys ever heard or played with

Molecule?

Justin Rue: I know a turtle.

Jason Anderson: All right. So, Molecule is a tool that allows you to do unit testing inside of Anible. So depending on what your base environment is, you can spin up a container on your local laptop, run your Ansible playbook against said container, and then log in and make changes to do whatever you want before you commit your code. If that solves your problem, that's something we can talk about.

00:15:09

Jason Anderson: If not, uh I I will have to look for something else.

Justin Rue: So this is like a dev container as a test.

Jason Anderson: Exactly.

Justin Rue: Okay. No, thank you. So that for sure. Thank you.

Jason Anderson: Yeah, I I will I will send you some information after this call uh around um molecule. Not a problem.

Justin Rue: Well,

Jason Anderson: I'm actually

Justin Rue: I was I was really like having trouble with Navigator because I wasn't really able because I ran into container and it would just take forever for my doctor to stand up and I just I cleaned up my entire life.

Jason Anderson: Yeah.

Justin Rue: I was doing so much better.

Jason Anderson: Yeah. No, I like this. You know, the only caveat to this is whatever you're deploying your configuration to, you need to be able to mimic that environment in a container. um that is the you know the only requirement because then you can launch that container on your workshop or on your local dev and do all your unit testing and make sure everything's great.

00:16:16

Jason Anderson: That is the only got you that you have to make sure you have that base container for them to work with.

Justin Rue: Okay. Yeah, that's interesting. I'm not sure I haven't chosen our exact use case, but I'll definitely do some research.

Jason Anderson: Okay.

Justin Rue: So maybe for other stuff

Jason Anderson: Okay. And then the one last call or thing I wanted to ask you about, uh, does the week of June 15th work for you guys for an on-site

Justin Rue: again question.

Jason Anderson: visit?

Justin Rue: I think did you ask me about the date before in via email?

Jason Anderson: Yeah, I sent you an email. Yeah.

Justin Rue: Um, I was looking and I think in June 15th, Mauricio, I think it's I was wondering if you could move it up because we have hackathon 8th and 9th, then we have it'll be the end of the sprint, the 15th and 16th. And we're always kind of like everyone's running around with their hair on fire trying to get their task done before the end sprint, right?

00:17:28

Justin Rue: So it's not great like everyone's always kind of not out time I

Jason Anderson: Okay.

Justin Rue: would say on the 15th or 16th but then we go right into iteration planning the 17th and 18th and 19th. So,

Jason Anderson: Okay.

Justin Rue: if we could push it out to like the 28th or the week of the 22nd or the week

Jason Anderson: Okay.

Justin Rue: of the week of the 22nd, if you're available for that, it may be Barrett, better or I think I don't know if you agree, Mauric, you know, and I'll have to get approval from my upper management either way.

Mauricio Da Graca: Yeah. Yeah. But I I agree. It's better to do it later on that it doesn't interfere with the, you know, iteration planning and all that stuff. So, I agree. I'll be remote though. So, uh whatever date works for me as well.

Jason Anderson: Okay.

Mauricio Da Graca: We still need to get the approval though. So,

Justin Rue: on site maybe.

00:18:20

Jason Anderson: Um

Justin Rue: I mean like the thing is like for PI planning they do push like onset

attendance so like you know you never know it could actually align but like I got to get Jake and managers to like want red hat to be a presence

Mauricio Da Graca: Yeah, exactly.

Justin Rue: right because like are you guys going to come in rolling deep Jason or is just like a a few folks in terms of intent

Jason Anderson: uh it really depends on what you're looking for, Justin. We are very flexible. Like we we can bring all technical resources.

Justin Rue: Okay.

Jason Anderson: We can bring executives. It it depends on, you know, where you're at and you want to go with

Justin Rue: Yeah, that's just completely throwing it through Jake and see. So, I think we should probably talk to Jake about it. Um, let's see what it's probably going to, you know, that would start with just um GCS team, you know, I'd say people now in GCS like give or take like

Mauricio Da Graca: That's like what 30 40

00:19:31

Justin Rue: like Yeah, like Yeah,

Mauricio Da Graca: 20

Justin Rue: like that around that.

Jason Anderson: Okay.

Justin Rue: Um, in terms of

Jason Anderson: Um,

Justin Rue: number

Jason Anderson: so I I'm going to ask a question because this PI planning, did you say you guys do that quarterly or you're Okay, that's rough.

Mauricio Da Graca: Yeah.

Jason Anderson: So you guys have quarterly sprints where you guys sit down and game plan what you're going to do for the quarters. Wow, that that's hard. That's a lot of planning. I generally do that for

Mauricio Da Graca: Yeah. So, no. So the the way that has been working so far is that every quarter uh we

Jason Anderson: the

Mauricio Da Graca: have uh a total of six sprints which ex each sprint is you know two weeks and uh we plan for that quarter. So uh every quarter we need to get together or at least our coach needs to get together and set up priorities based upon what upper management is looking for for this quarter.

Jason Anderson: All right.

00:20:41

Jason Anderson: Can I Can I ask a weird favor?

Mauricio Da Graca: So,

Jason Anderson: Is it possible for me to virtually be a fly on the wall? I would just love to hear what you guys are working on and what the priorities are. I won't say anything. I would just like to see if there's anything Red Hat can help out with.

Mauricio Da Graca: oh, that'll be something that Yeah, we can we can bring Jacob on and see if you guys uh if you guys can be able to jump in there and at least be the fly on the wall to give advice if there's anything in priorities that you guys and expedite that. That would be awesome.

Jason Anderson: Yeah. And I I mean that would be really helpful. The more we understand, the more we can help and that's the end goal. So, all right. Um well, that answers all the questions that I have at this point. uh if you can get back to me uh about the 22nd and let me know and then we can start game planning an agenda so you can make sure you get all the approvals and all of that good stuff and whoever we need to bring. Um I will send out an uh invite for 19th uh which is two weeks from today at 3:30. All right. And go rest up, dude.

Justin Rue: Okay.

Jason Anderson: I hope you feel better. And you know, feel free to give me a call anytime you guys need anything. Mauricio, that goes for you as well. I am here as a resource to help you guys out.

Justin Rue: Thank you, Jesus.

Mauricio Da Graca: Thank you very much.

Jason Anderson: All right. Hi, guys. Have a good one. Bye.

Mauricio Da Graca: Thank you, Jason. Bye-bye.
