Red Hat / HCL - Blue Yonder Discussion

Invited [Brad Childress](#) [Suellen Stroud](#) [Daniel de Araujo](#) [Anshuman Jain](#) [Pankaj Kumar](#) [Justin Deffenbaugh](#)

Attachments [Red Hat / HCL - Blue Yonder Discussion](#)

Meeting records [Transcript](#)

Summary

During an internal Red Hat Ansible Week meeting, Suellen Stroud and Justin Deffenbaugh, introduced by Brad Childress, discussed migrating Blue Yonder from AWX to Ansible Automation Platform (AAP). Daniel de Araujo explained that Red Hat faces difficulty engaging Blue Yonder directly due to their reliance on HCL, who views the move to AAP as an unnecessary cost, despite Blue Yonder being a strong RHEL customer. Brad Childress proposed collaborating with HCL to define the business value of AAP, emphasizing its ongoing security updates, new functionalities, and ability to address Blue Yonder's security concerns by enabling auto-healing for unplanned outages. Pankaj requested and Suellen Stroud shared resources detailing the differences between AWX and AAP to help initiate discussions with client partners.

Details

- **Introduction to Ansible Automation Platform** Suellen Stroud, an Ansible automation sales specialist, highlighted HCL's practice of migrating AWX to the Ansible Automation Platform (AAP) during an internal Red Hat Ansible Week meeting ([00:00:00](#)). Brad Childress introduced Justin Deffenbaugh, a solution architect, as a technical counterpart for their team ([00:00:56](#)).
- **Challenge with Blue Yonder and HCL** Daniel de Araujo explained that Red Hat sees a good opportunity to partner with HCL to promote Ansible to Blue Yonder, but they face difficulty engaging Blue Yonder directly because the client insists on going through HCL ([00:01:56](#)). Brad Childress elaborated that Blue Yonder is a strong Red Hat Enterprise Linux (RHEL) customer, with HCL acting as a reseller for their RHEL business. HCL supports a large combination of AWX, Ansible core,

and other automation tools for Blue Yonder, but HCL views Red Hat's proposal to move from AWX to AAP as an unnecessary cost or a threat to their business model ([00:02:54](#)) ([00:05:52](#)).

- **Proposed Solution for Blue Yonder Migration** Brad Childress emphasized Red Hat's desire to collaborate with HCL to define the business value of migrating Blue Yonder from AWX to AAP, rather than replacing HCL. They have prepared slides to discuss with the HCL team and welcome feedback to strengthen their case ([00:04:58](#)). Brad clarified that the immediate goal is not to secure budget but to build a compelling use case and narrative with HCL to present to Blue Yonder, focusing on the technological benefits of AAP over AWX ([00:20:58](#)).
- **AWX to AAP Migration Rationale** Suellen Stroud explained that Red Hat stopped contributing to the AWX community around July 2024 due to technical debt, refactoring AWX into 16 separate open-source projects ([00:09:58](#)). As a result, older AWX versions are no longer receiving updates or CVE (critical vulnerability exposure) fixes from Red Hat, making it the user's responsibility to integrate these fixes. The AAP offers ongoing security updates, new functionalities like event-driven Ansible and Lightspeed (AI ops), and a unified automation platform that the community-driven AWX ecosystem now lacks ([00:10:57](#)) ([00:17:07](#)).
- **Business Case for AAP Migration** Brad Childress highlighted that Blue Yonder has experienced ransomware attacks, making security automation a key focus ([00:22:39](#)). He proposed demonstrating how AAP could enable auto-healing for unplanned outages, reducing downtime and associated costs, which would provide a strong business case for Blue Yonder ([00:23:39](#)). He emphasized that the goal is to show Blue Yonder a better way to do automation rather than pushing for immediate payment ([00:20:58](#)).
- **Resource Sharing and Next Steps** Pankaj requested a one- or two-slider presentation detailing the differentiators between AWX and AAP to help them discuss with client partners. Suellen Stroud shared a checklist slide comparing AWX and AAP features and offered to provide a slide showing the decomposition of AWX into different microservices projects, noting that access to this document might be restricted but they would attempt to share it ([00:19:16](#)) ([00:25:29](#)). Pankaj expressed confidence in initiating discussions with client partners regarding AWX to AAP migration and potentially broader AI opportunities with Red Hat ([00:21:44](#)) ([00:24:36](#)).

Suggested next steps

Suellen Stroud will provide the link to the dashboard that shows the CVEs that have come out.

Suellen Stroud will send the announcement of Red Hat no longer contributing to the AWX community and the link to the CVEs that have not been incorporated into the platform.

Suellen Stroud will email the link of the project decomposition to pankaj and check if he can access it.

pankaj will start working on the PDF or the last two slides and get back to Daniel de Araujo.

pankaj will get in touch with the client partner and have a convincing discussion on the AWX to AAP perspective.

Red Hat / HCL - Blue Yonder

Discussion - Transcript

00:00:00

Suellen Stroud: part of uh Brad's team. I am the Anible automation sales specialist. So, we have Ansible week going on this week and my ears perked up the other day because they highlighted HCL on the call and it was highlighting this your practice that you have for migrating AWX to Anible automation

pankaj: All

Suellen Stroud: platform. So, Daniel, you and I spoke the other day.

pankaj: right.

Suellen Stroud: That was what they were talking about when I I was kind of half listening to this meeting and all of a sudden they talked about HCL and I perked up.

Daniel de Araujo: Okay.

Suellen Stroud: It's like what are they what are they talking about? So it was uh it was your AWX to AAP practice. So I support Brad uh in all of his with all of his customers and had to get them onto the Anible automation platform. So blue, this was an internal Red Hat meeting.

pankaj: Okay. So this this call was internal in the Red Hat or uh with the customer the call was going Oh okay.

Suellen Stroud: It's called Anible Week that we had going on right now.

00:00:56

pankaj: Okay.

Suellen Stroud: And so it was just to highlight some successes that have gone on uh with partners and customers and HCL was one highlighted.

pankaj: Okay, I got you.

Suellen Stroud: So thank you for that.

pankaj: Good to know.

Brad Childress: U and then I think the final person from the red hat side is Justin um who's really just another extension another technical counterpart um for my team.

pankaj: Good to know.

Brad Childress: So Justin I don't know if you want to briefly introduce yourself there.

Justin Deffenbaugh: Hey. Yeah. Solution architect uh technical front line. Good to meet everybody.

Brad Childress: Awesome. Um so yeah.

pankaj: I just

Daniel de Araujo: some oh say maybe I can set the context a little bit Brad and you can fill in all the big gaps that I'll I'll leave um and this is we what we talked about yesterday page is you know we've had blue yonder as an account for for a while we've done some decent business. We think there's a well we know I should say that there's a good opportunity for us to partner with HCL to drive Antible.

00:01:56

Daniel de Araujo: Um the problem is you know the CP is um he's a nice guy. I think he's can be a little difficult to work with. Right. So, we were hoping to get your help in helping him understand our positioning a little bit and seeing if we can get him to, let's say, leverage on latch on to this idea to drive through HCL because Brad's having difficulty talking directly to the client. The client is saying, "You got to go through HCL." So, we're we're we're a little stuck and we're looking for HCL's help. So Brad, I'll let you add on to that because I'm sure I'm missing a lot of pieces, but um hopefully that sets the context a little bit.

Brad Childress: Yeah. Yeah. No, that no that that's good context. And just to build off of that a little bit, Ben, so Blonderander is a really strong rail customer, Rail partner of ours. They're almost like an embedded customer for us um where they use RE as a part of their SAS uh warehouse management product.

00:02:54

Brad Childress: So they do about a million dollars a year of just RE. Um and that is all sold through HCL. So HCL is acting as a reseller on that business. Um we do quarterly true-ups with Blue Yonder that ranges from \$60,000 to \$100,000 um as a continuation from that renewal that we did with them in 2024. Um so HTL has been a really good partner in from that regard. Um there has been uh in just in terms of the makeup of automation that Blue Yonder um it sounds like it's a really large combination of AWX that uh HCL is supporting um Anible core uh they have point solutions there's big fix

which we know is a HCL tool. So there's just a lot of different automation sprawl across their IT environment. So, we've had several attempts at conversations with the HCL team directly on kind of how and why we think it makes sense to help them move from AWX to AAP. Um, we have very large incentives and programs in place that aren't even specific to HCL, but that are just a Red Hat process that are heavily discounted AAP SKUs and in a situation like this where a large customer is using a large amount of AWX.

00:04:02

Brad Childress: So, we think there's a lot of potential to work with HCL in that. Um, unfortunately, we just haven't really had much success in getting them to see our side. And I think they maybe have two concerns about it. I think one they look at it as just an extra and maybe unnecessary cost. So, hey, they have a fixed cost contract with Blue Yonder directly today. We don't know the amount of that. We don't need to owe me the amount of it, but let's just say it's a million dollars. And included in that a million dollars is patching, provisioning, automation services, which is really left to HCL to determine how they do that. And it doesn't sound like it matters if it's 10 people doing it on HCL or 100 people doing it at HCL. They are supposed to deliver those use cases at that amount. Um, so I think our positioning to HCL was very much of, hey, you could do more automation with less people. And I think they could have perceived that as maybe a threat to them or a threat to their business.

00:04:58

Brad Childress: Um, and we would like to work with them to programmatically move them away from AWX to what we think is a better automation platform or a more unified automation platform and really make HCL the mechanism of how they would help Leandonder do that. It's just doing it with our technology. So, we're definitely not trying to replace HCL in any way. We would love to work with HCL to kind of have them and work with them and built this message to Blue Yonder for what the actual business value would be from going from AWX to AP. Um we've put together a couple slides to review with um the HCL team that's supporting Blonde that we think kind of carries this case pretty well. We'd welcome your feedback on that too um in terms of how we can just make it stronger, more impactful.

Daniel de Araujo: Oops.

Brad Childress: But that is the the extra detail on top of what Daniel had already said. So I I know I just said a lot. So feel free to uh have me ask any questions or take a step back if anything if you need me to.

00:05:52

Brad Childress: Oh, and and you're on mute as well, yep.

pankaj: at the they are the large user of the RL right so the resell even the does there so it goes through the like the you it's a direct customer for you or it's like so so currently the Mhm.

Brad Childress: Yep. Nope. It's It's a Yeah, HCL is reselling. They did the reselling for the renewal that we did with them in 2024, which was over \$4 million for three years. Um, and then they are also doing the reselling on all of the true up quotes that we're doing for RE. And we would love for them to be the reseller for the anible engagement.

pankaj: So is there any other uh product landscape is there uh other than the RHL?

Brad Childress: Nope, it's just real today.

pankaj: Okay. Is there any other opportunity do you see there like uh VMware checkout or AI?

Brad Childress: Uh, not not take out. Um I see a big AI AI opportunity with them. Um and I think automation could be a big component of that.

00:06:51

Brad Childress: Um but Blue Yonder kind of touts themselves as being the AI driven um supply chain company. Um so they are very publicly touting of their AI practice.

pankaj: Mhm.

Brad Childress: They have a lot of AI resources and talent.

pankaj: Oh, so bas basically they have a in-house AI practices and they don't allow other people to pitch in in that AI right now.

Brad Childress: I I think they're they do a lot with Azure. Um, it sounds like Azure is their big partner. They have like a hundred million dollar annual spend with Azure. So, I think their virtualization is going from VMware to Azure Stack.

pankaj: Oh, so yeah. So the so there there may be a play of Red Hat also but they will go precisely on the native platform of the VM on the Azure like uh so that is tough nut to crack.

Brad Childress: Yep. Yep.

pankaj: I know that.

Brad Childress: Yep.

pankaj: Uh yes.

Brad Childress: So, and I think our focus as an account team has been more in line on the automation just because I think that is a much better story, a much easier story for us to tell versus trying to compete with what they're doing with Azure.

00:07:49

Brad Childress: It sounds like they have a really strong strategic relationship with Azure that that's fine.

pankaj: Yes.

Brad Childress: We don't want to disrupt that. If they have a decision to go through Azure stack automation or virtualization, that's fine. But I think there's a much I think there's a much stronger case uh both just from a technology perspective as well from a business perspective around Anible.

pankaj: Okay. Okay. And when you uh try to connect with the customer on the AWS because see what I am saying this is the uh generic phenomena I see which you rightly highlighted that the gsi thinks that I am already in the service area. I am getting a fixed amount of I am having the service on the AWX. AWX is a I I say they're pretty stable. We have not seen a complaint from the customer who is using the AWS from longer time. I know that from six years seven the classic example is Pepsi. I know that last seven years they are using AWS from the different vendor also. It's not that only the so I need to understand that what narrative you've been there and uh discuss with the customer that is I want to understand it's fine that okay we'll look into that okay how we can engage with the did you had any discussion with the customer on that okay AWX through AIP Mhm.

00:09:05

Brad Childress: No. And and that's mostly because to Daniel's earlier point, anytime we've tried to talk to them around automation or around some of the use cases that we'd be targeting, they've always deferred, well, HCL does that. Go talk to HCL.

pankaj: But uh my point is that the ultimate uh buying comes from the customer only. The funding has to be come from the customer only.

Brad Childress: Correct. Yep. to totally understand that and I think my my ask is to have

HCL work with us so we can build up what that business case to get them to transition from AWX to AAP would look like and that way HCL and Red Hat can go in jointly to the customer and say look we've talked with Red Hat we've worked together on what a solution would look like what a migration would look like here and here's our case if the customer says you know what we don't want to pay extra because it would be extra money compared to what they're doing with HCL today then that's fine but I think there's a pretty strong case for us to put together with HCL.

00:09:58

Brad Childress: And I think our challenge right now is that we're not really seeing the the interest from the HCL team to to allow that to happen.

Daniel de Araujo: Yes.

pankaj: Okay, I got your point. Okay, so that makes sense like it's at least we can pitch in uh then up to the customer that whether they want to go for that route or not, whether they have the budget and funding for that or

Brad Childress: Yep.

pankaj: not. One more point like uh what are the perspective that uh you guys are putting when you are moving from the AWX to AP? Is that something that Red Hat has start contributing to the AWX community or still we are committing Active

Suellen Stroud: That was why I actually raised my hand because I wanted to see if you knew about that.

Brad Childress: Yeah.

Suellen Stroud: So, um, last year, a little bit over a year ago, um, our, uh, chief architect and CTO for Anible put out an announcement saying that Red Hat was no longer going to be, um, making the contributions to the

pankaj: contribute.

Suellen Stroud: AWX community.

00:10:57

Suellen Stroud: It was being refactored basically. Um there was a lot of old tech debt in the AWX um platform as it was the way it stood a year ago. So that has been completely refactored. It no longer exists. So if you are running AWX today, you are running on a version that is prior to July of 2024. There have been no releases on the product since then.

pankaj: Okay.

Suellen Stroud: No CVEs have been incorporated in. It is the responsibility of the user to get those CVEs and to integrate those yourselves. We actually have a dashboard available. I think there's like 20 or 30 CVEs that have been that have come out. I'll have to get you the link to the dashboard that that shows that a CVE is a critical um error that occurs.

pankaj: Sorry to ask that. What is that CV?

Daniel de Araujo: vulnerability.

Suellen Stroud: It stands for something. What does a CVE stand for? Sorry.

Daniel de Araujo: It's like critical vulnerability exposure.

Brad Childress: and exposures.

Suellen Stroud: exposures.

00:11:54

Daniel de Araujo: Yeah.

Suellen Stroud: Yeah.

pankaj: Okay.

Suellen Stroud: Yes. So, um something critical has happened, a vulnerability has occurred in the platform and you know if Red Hat puts a fix out for it, it gets put out into the community. We're not putting it into AWX anymore because AWX doesn't exist anymore. AWX is now 16 different open- source projects and you have to decide as an open- source user which of those products you want to use and integrate them together yourself. So what was AWX is now just what we call the controller and that's it. If you want our back that's a separate project. If you want any of the other functionality you have to bring all of those together. So that that happened a little bit over a year ago. So, if you're still running AWX and you're not integrating or or making any updates to it, you're probably running a very old version.

pankaj: Okay. Okay. So, uh as I understand that after 2024 June, Red Hat has not been contributing to AWS and they are not Yes.

00:13:01

Suellen Stroud: There have been no there have been no new AWX releases since I will send you both the announcement. Everything is in the Everything is in the AWX community, by the way. There's a lot of information out there about, you know, when

updates are happening, you know, when things are changing, um, you know, different operators that have been deprecated, things like that. Everything has been out in the community and discussed there.

pankaj: Okay.

Suellen Stroud: Oh, thank you.

pankaj: But still I think the still the open still the people are contributing to AWX from outside.

Suellen Stroud: Absolutely. Absolutely.

pankaj: Absolutely.

Suellen Stroud: Yeah.

pankaj: Okay.

Suellen Stroud: Yes. It's just a different It's different than what it was before. or it's been broken up into these projects. We haven't had a new release there. You know, the community is still active and people are um contributing to it. We haven't had a new release though since this announcement happened.

pankaj: Okay. So I understand it has been refactor in the smaller smaller project.

Suellen Stroud: Yes.

00:13:58

pankaj: The older AWX was now broken into parts and the people are contributing in the bits and pieces in a different different project. The people who is running the AWX is the must be the older one which is like a year at least ago which was call it as AWX and contributed by the Red Hat.

Suellen Stroud: Yeah. Yeah, exactly. If you're running a stable platform, you're running it prior to um Brad put the link in here from the announcement and that should have I believe that was Matt Jones who yeah that was Matt Jones the chief architect

pankaj: Home.

Suellen Stroud: for Anible where he basically laid out what I just said that there was a lot of tech debt. You know, we needed to refactor that because our Ansible automation platform is built on top of these components, right? Ansible core. We needed to make our product um in microservices so that we could push out updates faster and we needed to make this change to the community because it was just such an old platform.

pankaj: Yes.

Suellen Stroud: It needed to be updated.

00:14:55

pankaj: correct correct that that I know the history of that one. Okay.

Suellen Stroud: Yeah.

pankaj: So now the what is the differentiator that one is like that there's no contribution it's not it's just open source project which the people are using with the no control that anybody can do the any changes or maybe like there's no support and all that I understand the differentiator is basically like the one is the support from the red hat and like regular update on the anible product from the red hat enhancement I can say that is what the differentiator from AWX to AAP

Suellen Stroud: um well that the fact that yeah I mean you're you're relying on the community for any updates you're also relying on you know if you if you move forward from the older version and you move into the new microservices version you have to decide ide which projects you're going to pull together, integrate those together, and then what vulnerabilities are you going to patch the system for?

pankaj: That's true. But still I think we have not listened any noises on the AWX right whoever is using did you have any no did you had any uh customer who came the complain of the AWX usability that it's not stable

00:15:58

Suellen Stroud: You have it. I don't I I don't usually talk to c I mean I talked to them about anible automation platform.

pankaj: we are facing the issue Oh.

Suellen Stroud: So you know we have had customers that moved from AWX to the supported platform. So I I don't really have a finger on what is going on in the AWX community.

pankaj: No. So when they they moved from the AWS to AP uh it was just on the differentiator of the Red Hat support and the Red Hat product or it was just or there was some pro problem statement from the customer side also because I want to use that problem statement.

Suellen Stroud: Okay. Um, you know what? I I think I've got a list of probably references. Um, by the way, those were the this article is an open um the link I put in there are the CVEEs that have come out, the vulnerabilities that come out since the first link since the announcement was made that have not been um incorporated into the platform. So yeah, that that that list should be updated.

00:17:07

pankaj: Okay, that's great. That's great.

Suellen Stroud: When's the last update on here? It's supposed to be updated regularly. Uh, April was the last update. They they'll they'll they're probably focused on G6 right now. So, they'll get around to updating this, but we we try to keep this list updated on on what vulnerabilities have we fixed in the platform that if you're using the community, you have to go find the fix and

pankaj: Mhm.

Suellen Stroud: and integrate it. So that was that's one of the reasons you know a lot of people from a CISO perspective want to make sure that they have a platform that is secure that isn't introducing vulnerabilities into their environment. So a lot of it has come from that.

pankaj: Well, Mhm.

Suellen Stroud: There's also things um Brad since you're showing that uh scroll down you just were on the one you were on before.

pankaj: One thing is that if they are running for the production that they are just carrying a risk that is one thing is also Yeah.

Daniel de Araujo: That's probably the biggest ones.

00:18:04

Suellen Stroud: Yeah.

Daniel de Araujo: Yeah.

Suellen Stroud: Yeah. Um there's also new functionality that we are adding into the platform that some of it is in the community, you know, like uh event driven anible, um light speed, those are things that you're going to get with the platform. So yeah, AI ops is the biggest thing right now.

pankaj: H yes. AI perspective basically Watson has been used for the light speeded.

Brad Childress: Yep.

pankaj: Yes. Yes.

Suellen Stroud: It's how do we how do we um understand what's going on in you know especially from an ED event driven anible perspective how do we understand what errors are occurring in the environment in the entire environment using AI

pankaj: So yeah.

Suellen Stroud: ops to figure out what that is and automatically triggering a remediation or notification through event anible which calls a playbook. So I mean the underlying technology is still the same the playbook but it's how am I going to trigger that? How am

I going to react automatically within the environment?

pankaj: Yeah, I understand. Do you have a one slider or two slider on the like basically which talks about the uh to the point on like AWX to AAP?

00:19:16

pankaj: Why AWX to AAP the differentiator of any one slider or two slider?

Suellen Stroud: Um so Yeah.

pankaj: because I want to voice over those things to these guys client partner when I am going to talk to them because I know on my top of the mind but I want to be precise when I'm going to talk to them.

Suellen Stroud: Uh, Brad, can you bring your slide deck back up? The the checklist is probably a good one.

Daniel de Araujo: Mhm.

pankaj: Yeah, comparable checklist type or something.

Daniel de Araujo: That last slide had Yeah.

pankaj: Yeah, you are right.

Suellen Stroud: I think the checklist because it just column here's what's in AWX, here's what's in AAP.

pankaj: Yeah, I think that Yeah.

Suellen Stroud: That's probably um Yeah.

pankaj: Yeah, that should be fine for me. That should be fine for because I will derive the information from that.

Daniel de Araujo: If you go to the end, you go.

Suellen Stroud: there.

Daniel de Araujo: There we go.

Suellen Stroud: Right there. That's That's probably the easiest. I mean, I can um I I don't know if you've got the one that has all the microservices in there.

00:20:02

Brad Childress: Uh, I think Chris Cool.

Suellen Stroud: No, I I don't see it in there. I mean, I I would go with the checklist because to me, that's just kind of black and white. It's here or it's not here.

pankaj: Okay. So if you can share me this deck is fine otherwise last two one is also fine for me to drive the information when I am going to talk to the client partner uh because

uh this this use case AWP2 AP like I am driving from longer time okay and uh let me talk to them the challenges which I see from the budget issue I know always but the the convincing factor is that okay we can convince

Daniel de Araujo: Cool.

Suellen Stroud: Okay.

pankaj: them to become on the table and just go ahead and we'll talk to the customer. If customer is not fine for the budget and the proposal, then we are go ahead. We are good to that one. At least we can try to have a uh common ground where we can both discuss and get to the customer.

00:20:58

Brad Childress: Yeah. And and to be honest, I'm not as concerned about budget right now. Like I I think I would more so want to talk with Blonder directly with HCL just around the use case, the technologies, the story behind why we think AAP is a better solution than what they're currently doing.

Daniel de Araujo: Yeah.

Brad Childress: And even if they don't have budget for it, that that's fine. But I'm I'm afraid that they just don't know that there's a better way to be doing automation at the level that they need to be doing automation for.

Daniel de Araujo: Yeah.

Brad Childress: And that that's the story. That's the conversation that I would like to have with Byandonder. If they don't have money until next year, that's totally fine. But I would like to start building that case and building that conversation for them for why they need to be looking at this instead of why they need to be giving us money right now for that.

pankaj: Correct.

Brad Childress: That that's definitely not the ask right now.

pankaj: No, I do understand.

00:21:44

Daniel de Araujo: Good night.

pankaj: Okay.

Brad Childress: Sure.

pankaj: Let me uh you just send me the that uh PDF or uh the last two slide.

Daniel de Araujo: Something

pankaj: I'll start working on that. Okay. And get back to through Daniel. Okay.

Brad Childress: Okay.

pankaj: I'm confident enough at least I will get them on the table for the discussion.

Brad Childress: And cool. That would be great.

Suellen Stroud: I just threw Yeah, Brad, do you want I'll copy all these links unless you've got them already. Um, I just threw a quick reference that I found.

Brad Childress: I think Cool.

Suellen Stroud: Ticket Master moved from AWX to Anible Automation Platform and there's a a public reference out there. I was trying to find ones that were public real quick. So

Brad Childress: Um, no, I think Pinkage the the use case that we had in mind specifically that we thought might be a mutual benefit for HCL as well.

Daniel de Araujo: Oops.

pankaj: Mhm.

Brad Childress: Um, and I'll just share my screen again. I don't want to bore you with slides, but oh, I'm not sure where we get this one here.

00:22:39

Brad Childress: So we we typically tie Ansible and our use cases to one of these core four like especially when we're talking to an executive they're typically driving towards at least one of these things and Ansible helps them achieve at

pankaj: Mhm.

Brad Childress: least one of these four depending on which use case they want to target. So these from just a technology perspective are the typical use cases that we'll see anible being plugged into and we would like to focus on the security automation part in in particular one because Blue Yonder has been the

pankaj: Okay.

Brad Childress: victim of several ransomware attacks over the last few years and they I think have security pretty much top of mind for them.

pankaj: Okay.

Brad Childress: But one of the things that we were trying to just do some discovery on with the HCL team is when something breaks in Blue Yandre's environment today, what is the SLA required from HCL to get that service back up and running and how are they doing that? Is that a manual process? Is that an automated process with AWX or could this be something they could introduce AAP for to where something's breaks and then there's an automated fix and play through AAP?

00:23:39

pankaj: basically you are talking about the auto healing

Brad Childress: Yep. Auto healing. That that that's correct. And what we would try to determine with HCL before we even talk to the customer and there's a lot of numbers. There's a lot going on in the slide that we don't really need to worry about is just this bottom two. How many how many unplanned outages do they have a year? And this slide goes into kind of the inputs. How many unplanned outages or downtime incidents per year? What is the average cost of a downtime per year? And then what is the meantime to repair that? So let's just say their meantime is two hours.

pankaj: Okay.

Brad Childress: Then what does it mean for us to be able to do it in one hour or a half an hour or 20 minutes instead? And that way we can go to Blue Yonder with actual business case. Not just hey here's why you should move from AWX to AAP, but here's what you can do with AAP that if you want to do it with AWX would take a whole lot of people to build that out for you and it's just a less secure environment and automating platform to do that on.

00:24:36

Brad Childress: So that is kind of the I guess the story or what we'd want to work on with HCL in particular and then go to Blue Yonder with kind of a cohesive story and argument for why we think AAP is the better platform for them.

pankaj: I got it. I got so uh one last question. They do they do passover or they are doing the manage services here for the resale perspective. It's a CCSP or it's just a pass through there.

Brad Childress: Yeah, it's just a pass through.

Daniel de Araujo: That's true.

pankaj: Okay. Maybe like the services they have the different fixed fixed amount budget for the services which they are providing.

Brad Childress: Okay.

pankaj: Okay, I think good to have this information. just send me that slide which I requested and I will get in touch with the client partner and uh just see that okay how he how he or she can we have a convincing discussion on the AWX to

Brad Childress: Yep.

pankaj: AAP perspective and maybe like other broader aspect maybe they are working and they want to have a some AI uh uh like uh perspective from the Red Hat also so there also we can engage Yeah.

00:25:29

Brad Childress: Sure. Yeah, I think that sounds great.

Suellen Stroud: Yeah. Um I I'm sorry. I know we have like one minute left. Um I did find the slide that shows what the project is being broken into. So, I just want to share that with you. Just show it to you real quick.

pankaj: Please, please. Yeah. Please show me and just send me also.

Suellen Stroud: Um, I think that's kind of um it's under NDA, but I should be able to share it with you at least. Do you have access to you're you're a funded head from us.

pankaj: Yeah. Yeah.

Suellen Stroud: Do you have access to our our documents?

pankaj: Yes.

Suellen Stroud: Like if I shared the link with you, let me share the link with you.

pankaj: Yeah. Sometimes what will happen? some document like I it is restricted and I don't have the access that docs do yeah please yeah Mhm.

Daniel de Araujo: I got it.

Suellen Stroud: I I'll email it to you and if it if it works, it does.

00:26:18

Suellen Stroud: That's great. But this is where the decomposition has come in into these different microservices. So that's why you know it it doesn't exist as it as it used to and you know there hasn't been there hasn't been a new release done since this was announced because they're still so busy working on it plus doing other things. Um so anyhow I'll I'll share this link with you but this really is you know if you want authentication arback telemetry inventories run times those are all going to be different projects that you have to integrate together now

pankaj: Mhm.

Suellen Stroud: where before we used to just we had four people that were on staff that's all they did was really compile this and put it out. Well, those people have been kind of, you know, moved over to making changes and updates to the a to a anible um product that we have and also still working in the community.

pankaj: Oh, huh.

Suellen Stroud: We're just leaving it to, you know what, some people don't need everything. Some people only need a couple of these projects. So, we're letting it kind of in the true open-source fashion, letting the community decide what it is they need.

pankaj: Oh, so basically like now those project is not now integrated to AWX centralized project that those are now independent not sure.

Suellen Stroud: Exactly. They're not integrated. They're each one is individual. That's exactly it. The picture says a thousand words. I will share this document with you and you let me know if you can access it. If not, I'll figure out how to share it with you. Okay.

pankaj: I'll do that. I'll do that. Okay. I think it Yeah. Thanks. Thanks Daniel to pick like schedule this call.

Suellen Stroud: Okay.
