

Based on the provided sources, Panasonic Avionics Corporation (PAC) relies on a robust ecosystem of IT, cloud, and professional service partners to execute its strategic pivot from a traditional hardware manufacturer to a cloud-native, software-defined services provider. Here are the key technology and professional service partners leading their digitalization, alongside the Lines of Business (LOBs) they influence:

1. Amazon Web Services (AWS) & SecureCloud Technologies

- **Focus:** Cloud infrastructure, Data Analytics, and Machine Learning.
- **Professional Services: SecureCloud Technologies**, an AWS Premier Partner, provided professional services to help PAC securely migrate sensitive data to the cloud, building an elastically scalable data lake in Amazon S3 1.
- **Lines of Business Influenced: Digital Solutions, Data Analytics, and Aircraft Maintenance.** AWS hosts the "Avionics Specific Data Lake," which leverages machine learning to process telemetry and give airlines near real-time insights into passenger behavior, operations, and the health monitoring of aircraft IFEC systems (like the NEXT platform) 2, 3.

2. Microsoft Azure & SoftwareOne

- **Focus:** Core cloud infrastructure and workload containerization.
- **Professional Services: SoftwareOne** partnered with PAC to execute a cloud migration to Azure that resulted in a 50% reduction in annual IT costs and improved service delivery speed 4, 5.
- **Lines of Business Influenced: Internal IT Operations and App Management.** Azure serves as the primary cloud destination for containerizing and migrating legacy on-premises monolithic applications 5, 6.

3. Red Hat

- **Focus:** Hybrid-cloud orchestration, IT automation, and edge computing.
- **Lines of Business Influenced:**
- **Panasonic Technical Services (MRO):** PAC uses Red Hat's Event-Driven Ansible (EDA) to automate IT service management and maintenance, repair, and overhaul (MRO) tasks, drastically reducing aircraft downtime 7, 8.
- **Software Centers of Excellence (IFEC Development):** PAC uses Red Hat OpenShift to unify application development and Red Hat Enterprise Linux (RHEL) / Device Edge to create secure, immutable deployments for aircraft seat-end monitors 9-11.
- **Media Content Services:** Red Hat Satellite and Ansible are used to automate air-gapped media content delivery securely 12.

4. ServiceNow & NetBox

- **Focus:** IT Service Management (ITSM) and infrastructure automation.
- **Lines of Business Influenced: Internal IT and Network Engineering.** NetBox acts as the source of truth for global infrastructure, while ServiceNow manages change management approvals. Both are integrated with Event-Driven Ansible to automate DNS provisioning, load balancer management, and asynchronous network changes 7, 8, 13.

5. GitLab & CrowdStrike

- **Focus:** DevSecOps and Cybersecurity.
- **Lines of Business Influenced:**

- **Media Content Services:** GitLab provides secure source control for automated deployment pipelines 12.
- **LEO Connectivity Infrastructure:** CrowdStrike is utilized to monitor and validate quantum-safe encryption layers across the fleet, securing the massive amounts of data flowing through new Low Earth Orbit satellite networks 14.

6. Anthropic

- **Focus:** Artificial Intelligence (Generative AI & LLMs).
- **Lines of Business Influenced: Corporate Strategy and Passenger Personalization.** As part of the broader Panasonic HD "Panasonic Go" initiative, Anthropic's Claude AI is being integrated to scale personalization for customers, extract data value, and drive advanced AI-assisted business transformations 15-17.

7. SHI

- **Focus:** IT Procurement and Licensing.
- **Lines of Business Influenced: IT Administration.** SHI acts as the Value-Added Reseller (VAR) managing the procurement and licensing distribution for PAC's advanced IT and AI features 18.
